An exhibit of the work of the Soil Survey was prepared during the early part of the fiscal year, and during September and October a man from the division, accompanied by representatives of certain other bureaus of the department, visited a number of State fairs for the purpose of presenting and explaining the work of the bureau. During the latter part of the winter a more elaborate exhibit was prepared. This was sent abroad for use in the field schools of agriculture maintained in France for the benefit of American soldiers.

Much advice and information by correspondence was given during the year. This work was heavier than usual, owing to the country-wide interest in war gardens, and involved the examination of a large number of samples of soil.

The work of studying the truck soils of the eastern United States continued during the year, with some interruptions caused by emergency calls to other work, such as the preparation of the exhibits for the fair circuits and for the American soldiers in France. The field work in the Charleston area was completed and the report prepared for publication.

At the suggestion of the Railroad Administration the preparation of a series of reports on the soils of certain of the Southern States was begun, and on June 30 considerable progress had been made on the initial report of the series.

CHEMICAL INVESTIGATIONS.

During the fiscal year 1919 miscellaneous samples from other departments, other bureaus of this department, outside institutions, and private individuals have been analyzed or examined as usual. These have included the alkali analyses of soils for the Geological Survey and the Bureau of Standards, the examination of park soils for the District government, cooperate tests of soils from the Arlington Farm for the Bureau of Plant Industry, and the examination of numerous samples of rocks, minerals, soils, etc., supposed to be of value as fertilizer.

During the earlier part of the year research work on the composition of soil types was continued, but later this was abandoned on account of the rush of war activities. After the signing of the armistice work was resumed upon this subject. The major research activities of the Chemical Division, however, have centered about the chemical and mineralogical nature of the materials extracted from soils by treatment with water. A number of minerals have been identified in these products and it has been shown that the evaporated water extract of soils leaves a residue showing considerable resemblance to the Stassfurt and other natural saline deposits. A material, provisionally called ultra clay, has also been obtained by these extractions and its properties are now being investigated. These lines of work, together with the study of the chemistry of the soil solution, now well under way, are in certain respects unique and give promise of important results.

The war activities consisted mainly of the analysis of numerous samples of zircon sands in cooperation with the Bureau of Mines, the Geological Survey, and the Bureau of Standards. For some time this work absorbed the whole attention of the division. The other direct war activity consisted of the determination of the lime requirement and the preparation of various special soils for the Chemical Warfare Section.

The head of the division, Dr. E. C. Shorey, resigned and a new head was not appointed until the close of the year. During the greater part of the year a large part of the personnel of the division was detailed to the Fertilizer Division for war work on nitrogen products.

FERTILIZER RESOURCES INVESTIGATIONS.

FERTILIZER CONTROL.

During the fiscal year 1919 the Division of Fertilizer Resources Investigations worked in cooperation with a number of other gov-

ernmental agencies on problems directly or indirectly connected with fertilizers. Until the signing of the armistice the division assisted the Office of Fertilizer Control, furnishing technical information regarding fertilizers, their sources, supply, and manufacture, and advising on many problems arising in Government control. With the cessation of active hostilities and the disbanding of the emergency organization certain phases of the work upon which the Office of Fertilizer Control had been engaged were placed in charge of the Bureau of Soils and became a part of the duties of this division.

In response to complaints of farmers of the high cost of fertilizers, an investigation was made of retail prices in the Southern and Eastern States, where practically all the fertilizer used in this country is consumed. In gathering these data the bureau was assisted by the States Relations Service, working through its county agent organization. The results, published in circulars of the department series and appertaining to conditions in the months of May and June, 1919, showed not only excessively high prices in many parts of the country, but also striking inconsistencies between the quotations of dealers in adjacent counties and even in different parts of the same county, the disparity being much greater than could be explained away on the ground of differences in freight rates.

It is believed that the publication of the information has tended to equalize prices, or at least has put the farmer on his guard and shown him that he can save much in the cost of fertilizer by judicious purchasing.

Studies of the fertilizer trade also have been concerned with existing methods of computing the cost of manufacture, of establishing wholesale prices, and of providing for distribution.

NITROGEN INVESTIGATIONS.

Work has been continued on the fixation of atmospheric nitrogen in cooperation with the Bureau of Ordnance, Nitrate Division, of the War Department. This has involved three lines of investigation: (1) The synthetic, or so-called Haber process for the formation of ammonia from hydrogen and nitrogen; (2) the preparation and use of cyanamid for fertilizer purposes; and (3) the utilization of the silent discharge at high potential for the production of nitric acid. The first of these investigations had advanced to such a stage that we were able soon after war was declared to be of considerable service to the War Department in investigating their special problems, the Arlington laboratory being put at their disposal for such purposes. In the year just closed work along all of the lines mentioned has been extended. At the invitation of the Fixed Nitrogen Research Laboratory, the men engaged in these investigations have been moved to the American University to continue the work in cooperation with the War Department.

PHOSPHATES.

Investigation of a method for the manufacture of phosphoric acid by smelting the rock and recovering the acid from its gaseous state has continued during the year. In the last report mention was made of the results achieved with a specially designed furnace of small size. This contrivance, itself the result of much experimental work, is operated with fuel oil, and possesses the advantage over the electric

furnace first tried of being much cheaper to run. Experiments with the new type of furnace are being carried out on a larger scale to determine its commercial value. If the feasibility of this method can be shown, its ultimate general adoption by the producers of acid phosphate would seem assured, for the advantages—elimination of waste in mining, production of a pure acid, and saving in the cost of hauling an immense tonnage of inert material—are manifestly too great to be ignored by those engaged in the business of phosphate manufacture.

POTASH.

Investigations of the potash resources of the country have been continued principally in connection with the recovery of the salt from flue dust and its production from kelp. Many samples of the dust from blast-furnace stacks and some additional samples from cement plants have been collected and analyzed, and the bureau sees in this field the opportunity to produce much of the potash needed in the agriculture of the country. Work is being done on the availability of the potash found in blast furnace and cement-plant flue dust.

During the fiscal year ended June 30, 1918, the kelp plant at Summerland, Calif., in charge of Dr. J. W. Turrentine, was in partial operation. The close of that year found this organization approaching the end of its first year of operation. It was struggling with many problems and difficulties, some of inherent origin and some resulting from the national condition of a state of war. In spite of these, however, the experiments and the investigations were being actively prosecuted with a view to the determination of by-products, the elaboration of processes for their recovery, the perfecting of processes already installed, and the establishment of complete cost and efficiency data regarding all features. These problems were under full development. Organization and production had been brought to a point where over considerable periods operating expenses were approximately equaled by proceeds from sale of the products dry kelp and kelp ash.

At the beginning of the new year, the problem demanding most immediate solution was that of the large-scale leaching of kelp char. This had to be done mechanically and by a nonintermittent process. Processes devised by other concerns were either entire failures or cumbrous and highly inefficient. Following plans drawn up in this office and data established by experimentation here, a lixiviator was constructed and installed and put into operation which represented the immediate and complete solution of this problem.

Following this, the evaporator equipment, already tested by intermittent operation, was put into steady use, and high-grade potash salts became a daily product. Centrifugal and rotary, counter-current, hot-air dryers were installed to reduce the potash salts to the desired moisture content, and a material of high potash content and of a satisfactory physical condition was thus established as a daily product.

As in every other operation, a considerable period of time was consumed in training our operating crew in the details of producing potash salts and in studying the best method of operation of the

apparatus installed. Although the evaporator and crystallizer have been in successful operation for half a year, the refinements of operation yielding potassium chloride of the highest degree of purity have not yet been introduced. This being a matter of no immediate urgency, it has been permitted to await a more favorable opportunity.

As a part of the problem of determining the various factors that influence iodine with respect to its concentration and condition in the various stages of its course from the wet, raw kelp to the mother liquor from which iodine is precipitated, Prof. Merle Randall, of the Department of Chemistry of the University of California, is making a complete study of the composition of solutions; and, on the basis of the results to be obtained, it should be possible easily to introduce those modifications in process which will result in a grade of product so high as to commend itself to the chemical trade and demand a correspondingly high price. No source of potash is known to us which lends itself so readily to the preparation of a chemical grade of potash as does kelp. Every consideration demands that the highest grade of potash practicable be striven for.

A year ago it had just been established that the charcoal yielded as a by-product by the lixiviator and remaining after the potash and iodine had been removed possessed potentially high value as a bleaching carbon or agent for removing coloring matter from a variety of organic liquids and solutions not susceptible of bleaching chemically. This was shown to be potentially as valuable as a material formerly imported from Europe and selling at a price of 20 cents per pound. Recognizing the possibilities which lay in such a by-product, every effort was made both to determine definitely its bleaching power when applied to various classes of products and the best method of its manufacture in satisfactory and uniform condition. Neither problem is yet completely solved, as tests are still being made here and also collaboratively by various commercial concerns, both on laboratory and plant scale, and the ideal method of manufacture has not yet been devised. However, the matter has progressed to the point where sales have been effected at 15 cents per pound and production brought to the point where this product appears about to be able to pay the production cost of itself and of the potash also, if not ultimately the operating cost of the entire enterprise.

Certainly kelp char and potash combined should enable us to pay all expenses and probably yield a profit.

It is definitely established that the process in its present stage of development will yield iodine of a daily value of \$50 to \$75. It is entirely probable that a nearer approach to the theoretical will be attained.

A further development of the crystallization method employed should yield common salt of a degree of purity to warrant its sale as such in the local market in quantity sufficient to represent a considerable daily revenue and net profit.

It is now definitely established by large-scale operations over a period of months that the destructive distillation of kelp yields ammonia in that form which makes possible commercial recovery. Experiments to date indicate no considerable loss of the nitrogen of kelp in other forms. This fact, coupled with that of the simultaneous production of combustible gas of a quality and quantity sufficient

greatly to reduce if not to eliminate fuel consumption (the main item of expense), in connection with the distillation, and of kelp tar, whose subproducts, kelp oils and creosote, have been shown to be of value as flotation agents and disinfectants, respectively, not only justifies that process, but furthermore indicates the certainty wherewith these products may be looked to ultimately to pay the operating expenses of that process and to yield a profit besides.

A prospectus based on results as they stood June 30, 1919, is inserted here as illustrating what is now expected as the results shortly to be attained as the outcome of the present stage of these experiments. The conservativeness of the estimates should counterbalance the prophetic nature of the statement.

**PROSPECTUS OF VALUE OF PRODUCTS OBTAINABLE FROM 100 TONS PER DAY
RAW KELP.**

Potassium chloride, 95 per cent:	
2.5 tons=150 units at \$2-----	\$300
Or 150 units at \$2.50-----	\$375
or 2.5 tons chemical grade at \$250 per ton-----	625
Salt, NaCl, 95 per cent:	
1 ton at \$25-----	25
Iodine, resublimed:	
20 pounds at \$4-----	80
Ammonia, ammonium sulphate, 95 per cent:	
400 pounds NH_3 or 1,600 pounds $(\text{NH}_4)_2\text{SO}_4$ at \$4 per hundredweight--	64
Or aqua ammonia 26° at 5 cents-----	\$60
Bleaching carbon, Norit grade:	
1 ton, 2,000 pounds, at 5 cents-----	100
Or 2,000 pounds at 15 cents-----	\$300
Or 2,000 pounds at 25 cents-----	500
Total per day-----	569
25 days per month at \$569-----	14, 225
Or, per year-----	170, 700

Attention is called to the fact indicated by this prospectus that with potash selling at \$2.50 per unit this plant could be made self-supporting on the basis of potash alone.

We have set ourselves the task of realizing this prophecy, with the exception of the production and sale of ammonia, within the current fiscal year. Since it is believed that profit can be shown without ammonia, in view of the limited funds at our disposal for the current year and the expense (in materials, labor, and especially in time lost) in experimentation with retort furnaces, and since the full retort capacity will be needed for the production of bleaching carbon, it would appear to be wise to proceed with all dispatch to putting the plant on a producing basis with respect to potash, salt, carbon, and iodine, and to look to these for proceeds and profits. We believe that with these alone we can show a profit by the end of the year and that this fact should justify the acceptance of our recommendation that the enterprise be continued and enlarged until it can show whether or not the various other by-products now under investigation can be commercialized and likewise whether or not the process here employed is the most economical one.

In this connection it should be recalled that at the time the initial authorization was enacted three processes were under consideration; namely, (1) the destructive distillation of kelp, the process now under successful development here; (2) the fermentation of kelp;

and (3) the manipulation of kelp to yield feed materials and potash. The second of these was subsequently tested on a magnificent scale by a powder company, at the expense of several millions of dollars, full details of which are now in our possession and will be made a part of the department's records. The third remains to be developed, but preliminary experiments, both here and in France (the latter as a war-time investigation to develop a new source of feed for army horses), strongly indicate that it is entirely feasible while obtaining potash, to prepare a cattle feed in nutritive value of about the grade of oats.

It is the purpose, then, during the year now beginning, to emphasize production and to bend especial effort toward the production on the plant-capacity scale of the main and side products yielded by the process developed and now obtainable with the apparatus installed or about to be installed. At the same time, it is not intended to discontinue researches looking to the development of other products and processes, but on the contrary to pursue them with all the energy which the circumstances will permit. Effort is now being made to secure the services, on a permanent basis, of a research chemist who will reside here and work in the plant laboratory and give the various research problems his undivided attention. The advantage of a thorough laboratory investigation as the preliminary of any attempts to institute plant-scale changes in processes is so marked and its economy is so well recognized that it now seems advisable to await fuller experimental data obtained on the smaller scale before proceeding on the larger scale.

The opportunity for other and more detailed researches on kelp and kelp products is excellent. The field broadens tremendously as progress is made. A materially enlarged staff of chemical engineers, or chemists and engineers, could be advantageously applied to the study of these if funds and program warranted. It would be the greatest mistake to permit the present opportunity to pass without a complete study and solution of the more important of those.

SUMMARY.

(1) At the approach of the end of the second year of operation of the experimental kelp-potash plant, by-products have been discovered, developed, and their commercial obtainability established, which afford every assurance that kelp is to prove a profitable source of American potash, and that the department's work at Summerland will result not only in its complete justification, but also in the establishment of a kelp-potash industry of a substantial nature.

(2) As the year's program it is proposed to produce as many of those products as possible on a large scale in order to demonstrate profits. It is believed that the end of the year will find the plant on a paying basis.

SOIL PHYSICS.

During 1919 the regular research work in soil physics was largely suspended, owing to the employment of the force on nitrogen fixation work, but the routine work of the division was carried on as usual. The machinists were called upon to furnish a great deal of special apparatus and equipment needed in investigational work on war problems. Because of their special knowledge of the physical

factors involved, the larger part of the personnel of the division was utilized in work on the synthesis and oxidation of ammonia, carried on in cooperation with the Bureau of Ordnance, Nitrate Division, of the War Department. The work done was of much assistance to the War Department in solving problems involved in perfecting processes for the fixation of atmospheric nitrogen.

REPORT OF THE ENTOMOLOGIST.

L. O. HOWARD, *Entomologist and Chief of Bureau.*

CEREAL AND FORAGE CROP INSECT INVESTIGATIONS.

The work of this section, continued under the charge of Mr. W. R. Walton, has been of especial importance during the past fiscal year.

EUROPEAN CORN BORER.—In the last annual report of the bureau it was pointed out that this recently discovered insect, accidentally imported from Europe and thoroughly established in a limited region in eastern Massachusetts, threatened to become a pest of great importance throughout the corn-growing regions of the United States unless immediate measures were taken to stop its spread. Shortly after its discovery in 1917, it was shown to occupy apparently an area of about 100 square miles in the immediate vicinity of Boston. Later it was found in the Mohawk Valley of eastern New York, and careful scouting work showed that by the autumn of 1918 it had spread over an area of some 400 square miles. Scouting work in Massachusetts during the autumn of 1918 and the early spring of 1919 showed a distribution throughout 500 square miles of territory. A very vigorous campaign, looking toward extermination, was begun under State agricultural organizations; the New York Legislature appropriated \$100,000, the most of this sum being spent in the spring of 1919, and it is believed that much good was accomplished. A cooperative campaign was started in Massachusetts by Federal and State authorities under a State appropriation of \$50,000, and a considerable part of the infested area was treated in the effort to prevent the natural spread of the insect. A Federal appropriation was asked for, but the bill failed to pass Congress, and all of the work done in the spring of 1919 was carried on with funds provided by the States of New York and Massachusetts. The vulnerable point in the insect's life history is in its hibernation as a caterpillar in the stalks of corn and in the stems of other plants which it attacks, and there is a large list of these. Therefore the most effective work can be done only when the insect is in hibernation; and by the failure of the Federal appropriation the opportunity for very effective work was lost. The result was that, with the appearance of the moths issuing from untreated or imperfectly treated areas in Massachusetts, there was a spread at the end of the fiscal year, so that at the date of the present writing the insect is known to occur over an area of 1,000 square miles, extending from the New Hampshire border on the north to the towns of Marshfield and Brockton on the south, and to the west into the towns of Lincoln and Wayland.

Much new and valuable information regarding the habits of the insect was gained during the year, and several publications were issued by Federal and State organizations, including a Farmers' Bulletin (No. 1046) from the United States Department of Agriculture, giving information as to the best means of destroying the insect in its winter quarters. Several more or less effective means of destroying infested plants were discovered, and it is now being arranged to put these into operation on a large scale immediately after the expiration of the growing season of 1919. Fifteen trained entomologists are now investigating the habits and methods of destroying this pest, and every possible effort will be made to prevent its further spread.

THE HESSIAN FLY.—The annual spring survey of Hessian fly conditions has recently been completed and indicates plainly that this well-known pest is rapidly increasing in abundance in many localities, and has been responsible for a considerable amount of fallen grain in the States east of the Appalachian Mountains, especially in the Shenandoah and Cumberland Valleys. Reports from the western half of the Mississippi Basin also indicate a distinct increase. Warnings have been issued through the news service of the department so that wheat growers may plant at the proper date in the fall of 1919 in order to avoid loss.

THE NORTHERN ARMY WORM.—The true army worm appeared in numbers during late May, 1919, in northern Texas, and damage was done to growing grains soon afterwards through Oklahoma, Missouri, Iowa, Illinois, and western Ohio. The usual remedies were successfully applied in most of the infested territory. In eastern Indiana a serious local outbreak was successfully handled by the county farm advisers under advice from this bureau. In this case the poisoned bran bait was used with excellent effect.

THE SOUTHERN CORN ROOTWORM.—As a result of recent investigations, it has been found that in large portions of the States of Georgia, North Carolina, and South Carolina corn planted before March 31 or after May 10 is more or less immune from the attacks of the southern corn rootworm. The Coastal Plain, however, from southern Virginia to Florida differs, and no regulation of planting time seems seriously to affect the insect in this region.

THE ALFALFA WEEVIL.—A successful method of spraying alfalfa to destroy the alfalfa weevil has been found, and its efficacy thoroughly demonstrated in Utah. It is possible to apply this method successfully at a cost not to exceed \$1 per acre, and serious losses, even to the first crop of alfalfa, can be avoided. This first crop, under previous methods of control, was usually sacrificed. The large-scale use of this method during the early part of 1919 resulted so advantageously that the method will undoubtedly be generally adopted. The alfalfa weevil is at present causing much concern in Colorado, and spraying work has been undertaken in cooperation with the officials of that State.

GRASSHOPPERS.—Much valuable assistance in the form of personal advice has been given to State and county officials in the successful conduct of grasshopper extermination work throughout the States of North Dakota, South Dakota, Minnesota, Iowa, Montana, Cali-

fornia, Kansas, Nebraska, Missouri, Oregon, and Washington during the summer of 1918 and spring of 1919. The loss of many hundred thousand dollars' worth of crops has been prevented as the result of these activities.

OTHER INSECTS AFFECTING CEREAL AND FORAGE CROPS.—Studies of the jointworms have been continued with excellent results. Control experiments with the alfalfa-seed Chalcis have been carried on in cooperation with the Arizona Commission of Agriculture and Horticulture in the Buckeye Valley of Arizona, resulting in an apparent decrease of 15 per cent in the infestation and a net profit of more than \$43 per acre in the experimental plot.

Experimental control work on the coulee cricket conducted during the spring of 1918 was apparently successful, and the insect has made no destructive appearance during 1919.

Studies of the alfalfa caterpillar, the harvester ant, white grubs, billbugs, wireworms, and the European sawfly in wheat have been continued with favorable results. The last-named insect has been watched with especial care, because it seems capable of doing considerable damage to the winter wheat crop under conditions favorable to its multiplication.

STORED-PRODUCT INSECT INVESTIGATIONS.

Dr. E. A. Back has continued in immediate charge of this branch of the bureau's work.

CORN WEEVILS.—During the past year a laboratory has been established at Orlando, Fla., for the purpose of studying the biology and methods of control of corn weevils. Enough has already been learned of the biology of these insects to form the basis for control work. At Athens, Ga., an office has been established in cooperation with the Georgia Agricultural Experiment Station, from which expert information regarding preserving corn from weevils has been disseminated among southern farmers.

BEAN AND PEA WEEVILS.—The great increase in weevil losses to California-grown beans and peas during the past few years has led to the establishment of a laboratory at Alhambra, Calif., at which the causes for weevil increase and the methods of control are being investigated. The work has received the hearty cooperation of the bean growers and warehousemen of the Pacific coast.

FLOUR BEETLES.—The biology of various species of flour beetles of the genus *Tribolium* that attack flour in all warehouses throughout the United States is being made the object of an especial investigation with headquarters at Dallas, Tex.

FUMIGATION AS A CONTROL METHOD FOR STORED-PRODUCT INSECTS.—Experimental work to determine the usefulness of fumigation in lessening or preventing the enormous waste taking place through insect attack to stored goods in warehouses, though as yet extending over only a short period, has yielded practical results of great value.

ELECTRICITY AS A CONTROL AGENT.—During the past year cooperative work has been carried on to determine the effectiveness of electricity as a control agent in the suppression of insects in cereals in package form. A commercial machine for sterilizing cartons of

cereals after the latter have been sealed has been installed in a large cereal factory, with every promise of practical value. Should expectations be realized, the electrical treatment will result in great saving both to producers and consumers.

COLD STORAGE AS A CONTROL MEASURE.—The value of cold-storage temperatures in preventing insect damage to warehoused products has already been proved. Cold storage is being depended upon by wholesale and retail dealers of certain classes of foods and other products as the only satisfactory method of protection from insects. Detailed data regarding the effect of low temperatures upon various insects attacking stored products are being secured.

HOUSEHOLD PESTS.—Investigation of household pests other than the bedbug, flies, and mosquitoes, which was discontinued during the war, has been resumed. Several pests that are believed by the general public to be limited to houses, as clothes moths, cockroaches, and carpet beetles, have been found to be frequently very injurious to valuable materials stored in warehouses throughout the country.

INSPECTION AND INTELLIGENCE SERVICE.—The arrangements made during the war with the Quartermaster Department of the Army at the port of New York, whereby the bureau has undertaken to make frequent inspections of food and clothing supplies, proved so satisfactory that they have remained in force and are being extended to other food depots, not only of the Army but of the Navy. The purpose of this cooperation is to keep the Quartermaster Departments of the Army and Navy informed, through inspections made by bureau experts, not only of conditions of food supplies purchased and delivered at the warehouses, but also of their condition from time to time during the storage period. Such inspections detect and lead to the checking of insect ravages before the insects have had a chance to multiply and cause great loss.

The dissemination of information regarding the suppression of insects affecting stored food supplies and food products, which during the past two years has monopolized the efforts of this branch of the bureau work, is being continued, although the return to a peace basis is making it possible to open up the new lines of research indicated in preceding paragraphs.

DECIDUOUS FRUIT INSECT INVESTIGATIONS.

Investigations of the insects of this class have been carried out under the direction of Dr. A. L. Quaintance, as formerly.

APPLE INSECT INVESTIGATIONS.

CODLING MOTH.—Detailed life history studies of this insect, under way for some years in different parts of the country, were begun during the fiscal year in two new localities, and much additional knowledge, especially with reference to climatic conditions as affecting severity of damage, has been obtained. Numerous localities reported unusual injury to apples about harvest time, from recently hatched larvæ producing the so-called "sting," and there was considerable demand upon the office for local studies of the life history of the insect as well as investigations in orchards to perfect spraying schedules. The "sting" damage to apples in one State was estimated to have caused a loss of \$2,000,000 and the sum total of

injury done by this pest in different regions represents a very heavy tax on the apple growers.

In Colorado, where work is being done in cooperation with the State agricultural experiment station, the life history studies were completed and the work was confined to orchards. In the Grand Valley in this State codling moth losses have always been severe, and many orchardists have been unable to obtain satisfactory control, even by thorough spraying. Study indicates that this was due to lack of co-operation among orchardists thoroughly to spray over a large area. Consequently arrangements were made with a number of contiguous orchardists whereby they individually agreed to spray according to the department's recommendations, and thus try out on a large scale the effect of uniformity of spraying operations over hundreds of acres. This prevents the overflow of codling moths from poorly cared-for orchards into well treated orchards, and good results are expected.

Cooperative work in the Rogue River Valley of Oregon has been continued. The approximate dates when the larvæ of the different broods enter the fruit have been established, and a sound basis has been gained for a schedule of applications not only for apples but also for pears.

In the Ozark region in Arkansas similar work has been continued, and has been done cooperatively with the Bureau of Plant Industry on account of the importance of plant diseases in the orchards of that section. It seems probable that in that locality dusting can not be relied upon as a substitute for spraying. There are three full broods of the codling moth in this region and a partial fourth brood. There is a distinct interval between the appearance of the first and second brood larvæ, but from that date on they are continuously in the orchards. These life-history studies in this region have been practically completed, and a sound spraying schedule will probably be arranged by the close of the present season.

Work of this general character has also been carried on cooperatively in Delaware and in the State of Washington, and at the bureau's laboratory at Wallingford, Conn., the codling moth has also been studied. The insect in the latter region is much less troublesome than in the central, southern, and western regions, and it seems likely that a single thorough spraying at the time of the falling of the petals will prove sufficient to protect the fruit.

APPLE-TREE AND OTHER BORERS.—The work with the apple-tree and pear-tree borers has practically been completed, and publications will shortly be issued.

APPLE PLANT-LICE.—Intensive work has been done with these insects, especially with reference to the exact determination of alternate food plants and the identity of certain confused forms. This has involved an enormous amount of work, and decisive results are about to be reached.

In addition to the apple insects mentioned above, a considerable number of other species which live in apple orchards have been studied, but most of these are of lesser economic importance in the general run of seasons. As it often happens, however, that one of these minor pests becomes for a season or more very injurious, it is necessary that the bureau should anticipate such outbreaks by securing thorough biological information.

GRAPE INSECTS.

THE GRAPE-BERRY MOTH.—Vineyards were selected in several widely separated sections of the northern Ohio grape belt to serve as object lessons for vineyardists and to give them personal instructions in spraying effectively. It has been shown that the grape-berry moth can be controlled by two applications of arsenate of lead in spray form, leaving the fruit practically free from residue at picking time. In certain cases a single application has been sufficient, but here there were no surrounding badly infested vineyards. This indicates that eventually a single spray in general will keep the pest in check.

THE GRAPE MEALYBUG.—Full life-history studies of this insect have been finished. Fumigation with cyanid of soda and with sulphur fumes has been satisfactory in the dormant season at night, but sulphur is considered the better. January has been found to be the best time for this work. Spraying has proved less effective than fumigation. A campaign of education among grape growers has been begun to secure their cooperation in restricting the spread of the pest on picking boxes and in other ways.

THE GRAPE PHYLLOXERA.—In collaboration with the Bureau of Soils of this department, a survey of Fresno County has been made to determine the influence of the physical nature of soils on the degree of infestation of vineyards by the Phylloxera. Interesting and valuable facts have been ascertained. Investigations have been made concerning the best methods of disinfecting grape propagating stock destined for shipment.

THE GRAPE SPHINX MOTH.—An interesting instance of the value of entomological knowledge occurred when this insect appeared in numbers in Tulare County during the fiscal year, over some 700 acres of vineyards. The bureau's agent cooperated with the vineyardists, and, at an outlay of about \$12,000 for labor, spraying materials, and machinery, the grape crop, valued at \$180,000, was saved.

A number of other grape insects have been studied and new biological data ascertained.

NUT INSECTS.

PECAN INSECTS.—Special attention has been given to the use of insecticides in pecan orchards in Georgia and Florida. Arsenicals are being tried in the form of dusts and sprays, and another season's work should show conclusively the comparative merits of these two methods. In Texas, the bureau has been especially interested in the native pecan groves along river bottoms and elsewhere. In these native groves satisfactory control is very difficult and insect injury is quite severe; in fact, 90 per cent of the pecan crop here was lost during 1918. Three species of insects are principally involved.

INSECTS INJURIOUS TO WALNUTS, BUTTERNUTS, ETC., IN THE NORTHERN STATES.—This work, especially with the walnut curculio, the hickory curculio, and another species that attacks the leaf stems of hickory, and with other species as well, has been taken up by the bureau, with headquarters at French Creek, W. Va. A thorough investigation of insects attacking nuts other than pecan throughout the country will be carried on.

CRANBERRY INSECTS.

In the last annual report the beginning of the work on insects in cranberry bogs in the State of Washington was mentioned. This work, in cooperation with the Washington Agricultural Experiment Station, has been continued and important results have been reached. On bogs badly infested by the blackhead fireworm satisfactory results have been secured from three applications at intervals of from 17 to 21 days between May 1 and July 1 of nicotine sulphate containing 40 per cent nicotine used at the rate of 1 to 800, with the addition of fish-oil soap at the rate of 2 pounds to each 50 gallons, the spray being applied at the rate of 250 to 550 gallons per acre. Of the spray nozzles tested that known as the Bordeaux appears to be best suited. Growers have generally adopted this treatment and are getting good results. Detailed life-history studies of this insect are nearing completion, as are also studies of the cranberry root weevil. It has been shown of this latter species that it can be controlled by spraying the foliage during May and June with 2 pounds of arsenate of lead to 50 gallons of Bordeaux mixture.

A general survey of insect conditions is being made on cranberry bogs on the Pacific coast, and it is hoped that by the close of the season a report can be prepared on the principal cranberry insects of that territory.

PEACH INSECTS.

Tests of paradichlorobenzene as a treatment for the peach borer were continued through the growing season of 1918. Experiments with this gas have now been carried on during a period of three years in the peach districts of Maryland, Ohio, Arkansas, Virginia, West Virginia, and Georgia. In some cases blocks of trees have been treated two and three years in succession. It has been found that three-fourths of an ounce or 1 ounce of the chemical per tree applied in the fall after the moths have laid their eggs will result in the destruction of about 95 per cent of the larvæ. No injury has resulted from this dosage to trees 6 years old and over. Younger trees, on account of their thinner bark, have sometimes been injured.

Experiments as to the comparative merits of dusting and spraying in the control of the plum curculio and certain peach diseases have been continued in cooperation with the Bureau of Plant Industry at Fort Valley, Ga., Agricultural College, Miss., and Bentonville, Ark. The summer of 1919 has been an unusual one and control measures have been put to a severe test. The dusting method in a general way seems to compare favorably with spraying, even under the worst conditions.

THE JAPANESE BEETLE.

The introduction and establishment of this insect in the vicinity of Riverton, N. J., was mentioned for the first time in the last annual report. The work of eradication and control has been vigorously prosecuted in cooperation with the New Jersey State Department of Agriculture. The operations have been materially enlarged, but in spite of all that has been done the insect is increasing rapidly, spreading over new territory, and at the time of the present writing is perhaps 150 per cent more abundant than at the same time last year. Many experimental lines are being worked. Cyanid of soda in solu-

tion has been used to destroy the grubs in the ground, at the rate of 1 pound to 200 gallons of water and applied at the rate of 22,000 gallons per acre. While the beetles are flying, a wide barrier of poisoned foliage is maintained as completely as possible around the whole area of infestation. Where the beetles are most abundant they have been systematically collected in hand nets. An active collector can secure several quarts of the beetles in a day, and as each quart contains 4,000 individuals, this method is important. About 1,000,000 beetles have already been collected. Plowing the soil infested by the grubs and pupæ appears to destroy them. It will be necessary to do this kind of work very extensively in waste places and many areas not under cultivation. Weeds along the roadsides have been burned to destroy their food and render such places unattractive to the beetles, thus reducing the danger of their being carried by vehicles, pedestrians, and so on. In the same way, waste places along ditches and other spots which can not well be treated with cyanid are being cleared of weeds, and this work is being extended into the wide barrier of poisoned foliage surrounding the area of infestation. Close study is being made of the relative abundance of the insect in different parts of the area and on the methods of dissemination, and a quarantine is in force providing for the examination and certification of green sweet corn going out to market, since the beetles penetrate the tips of the ears and could thus be widely spread. A local citizens' committee has been established, which is of greatest assistance in the work of arranging cooperation of property holders with the agents of the bureau and the State. The work is now well organized, and we have a much better idea of the problem. It seems, from the rapid increase and spread of the insect during the summer of 1919, that the work must be greatly enlarged to be entirely successful.

INSECTICIDE INVESTIGATIONS.

At the various field laboratories tests have been made of many proprietary insecticides in comparison with homemade articles.

Work on the so-called "Derris," an insecticide made from plants of the genus of this name, has been completed. If this insecticide can be obtained in sufficient quantities it will prove an important addition to our list of substances that kill soft-bodied insects like plant-lice.

Studies on the various arsenical insecticides, like arsenate of lead, arsenate of lime, zinc arsenite, and so on, have been continued. Large-scale feeding experiments have been carried on with caterpillars and other insects. Experiments under different climatic conditions with these substances have also been continued. Additional experience confirms the conclusion reported last year that arsenate of lime may be used in all situations as a substitute for Paris green, and that it will also, for pomaceous fruits, prove a satisfactory substitute for arsenate of lead when used with lime or fungicides containing lime.

It has been shown that nicotine sulphate is an unsatisfactory substance to use against the eggs of the codling moth in the field. Nicotine is, however, coming rapidly into use as an insecticide in other ways, and the bureau has been trying to find a less expensive substitute. The results already obtained are promising. Basic studies in

connection with this work have been made on the physiology of injurious insects, especially on their olfactory organs, and a number of publications have been issued on this subject.

NATURAL CONTROL.

Under this head, studies of insect-destroying fungi have been continued, especially a fungous disease of cutworms. An obscure disease of the so-called seventeen-year locust, or periodical Cicada, has also been studied.

Work with the ladybird known as *Hippodamia convergens*, in the Imperial Valley of California, has been continued in cooperation with the California State Horticultural Commission, especially in regard to certain needed changes in the method of handling the insects. This work will be continued.

An especial study has been begun of the natural enemies of the plant-lice which are injurious to walnuts in southern California.

INVESTIGATIONS OF INSECTS INJURIOUS TO VEGETABLE AND TRUCK CROPS.

Work upon this group of insects has been continued as heretofore under the direction of Dr. F. H. Chittenden. Under the necessity for stimulation of food production much of the research conducted on the less important subjects under this head was temporarily discontinued, and attention was especially directed to the important staple crops.

SWEET POTATO WEEVIL ERADICATION AND CONTROL.

Continuing the policy of the fiscal year 1918, under a \$50,000 allotment for the eradication and control of this insect, intensive work was done. The definite boundaries of infestation were established in Florida, Georgia, Alabama, Mississippi, Louisiana, and Texas. More than 30,000 farms were inspected during planting and harvest (since at these times the presence of the weevil is most apparent), and the infested properties were listed and mapped. Large-scale experiments in control have been continued. In one large eradication project in Florida, selected for demonstration since it embodies most of the serious difficulties to be encountered, material progress has been made. All of the infested estates have been subjected to continuous supervision, contracts have been made with the growers for the destruction of all seed potatoes grown on infested land, and the scrupulous execution of these contracts has been rigidly enforced. More than 1,000,000 weevil-free sweet-potato draws have been distributed to growers by cooperation with the Florida State Plant Board. This materially aids in the eradication of the weevil without interfering with the production of potatoes, since the contracts provide for clean culture and a fallow period of six weeks prior to planting, together with other repressive measures. It is believed that as the result of this work the end of the growing season will find this locality practically, if not completely, weevil free.

In Alabama, the infestation was found to be confined to a single well-defined locality in Baldwin County, and excellent cooperation has been secured with growers toward the application of all necessary repressive measures. It is believed that this isolated outbreak will be entirely cleaned up in another season.

In Mississippi the passage of a drastic crop-pest law materially aided in the eradication measures, the establishment of a quarantine rendering complete control of intercounty shipments possible. The comparatively light infestation in this State has been mapped, and a material reduction of the area infested has been secured.

In Louisiana survey work has been continued, and growers have been visited and urged to apply methods devised by the bureau. Reinspection recently indicates that gratifying results have been reached in the majority of cases. A careful study has been made in this State as well as in Mississippi of the other food plants of the morning-glory group, especially the large-rooted perennial morning-glories, and a number of chemicals have been tested as weed killers, to be used against these wild food plants.

In Texas, 85 counties have been found infested with the weevil, which has been distributed apparently largely through commercial growers of slips shipping from the Gulf and south-central portions of the State. There is no law in Texas controlling the shipment of infested plant material, which is a serious drawback to the control of the weevil in that State. The fact that salable sweet potatoes can not be produced in some of the coast counties has helped the widespread distribution of the weevil, as draws grown from unsalable stock often prove more profitable than the growing of tubers. Life-history studies at Kingsville, Tex., showed at least six generations of the weevils annually, indicating an enormous rate of increase. Spraying experiments at this point have reduced infestation from 44.51 per cent to from 2.88 to 12.18 per cent.

INSECTS AFFECTING POTATO, TOMATO, AND ALLIED CROPS.

The potato aphid, an unexpected pest which made its appearance in 1917 and again in the early summer of 1918, was experimented with on into July, 1919. The use of nicotine sprays at increased strengths demonstrated practical control in Maryland, New Jersey, and Maine.

The spinach aphid, which has during recent years become troublesome as a potato pest, and which also affects cabbage, beets, lettuce, and other staple vegetable crops over a still wider range of territory, has been the subject of continued investigations along the Atlantic coast. A new station in the Aroostook region in Maine, a great potato center, has been established for the study of the Colorado potato beetle, the potato flea-beetle, and other potato pests. An investigation of the spread of the Colorado potato beetle on the Pacific coast has been conducted. The infested localities have been mapped and a campaign has been begun to spread a knowledge of the importance of control measures.

Other potato insects have been studied in Wisconsin and Iowa.

INSECTS AFFECTING GROWING BEANS AND PEAS.

The bean ladybird has recurred in numbers in Colorado and New Mexico. Experiments have shown that it can be controlled with lead arsenate and zinc arsenite sprays.

The enormous plantings of beans in southern California, owing to war conditions, resulted in serious injury to the crop from the corn earworm, and investigations of this insect under these conditions

have been made. The tremendous spread of this crop resulted in the great multiplication of the insect, and with the reduction of the bean acreage this season serious damage will very likely result from the abundance of the pest.

The pea moth, an imported pest already well established in Canada, has made its appearance in injurious numbers in Wisconsin, where it seems to be greatly increasing in number, necessitating additional investigations of its life history in order that a sound remedy may be established.

INSECTS INJURIOUS TO CABBAGE AND ALLIED PLANTS.

An investigation of the western cabbage flea-beetle, a pest of much importance in the Western States, has been completed, and the results are available for immediate publication.

The harlequin cabbage bug, after one of the periods of inactivity in the North which have several times been noted, is likely now to reinfest its northern range at any time, and an emergency bulletin on methods of control has been prepared.

An imported horse-radish pest, hitherto known as injurious only in Canada, has made its appearance in destructive numbers in Virginia, and is being studied. It will live on other crucifers, and if not controlled may become a pest of much importance.

SUGAR BEET INSECTS.

Work on the sugar beet leafhopper, which is the cause of the malady known as "curly-top," was terminated at Spreckles, Calif., and the station was removed to Riverside that the study of certain points in the life history of the insect and the relation of temperature and humidity to its development might be completed. A considerable percentage of parasitism has been observed during the year.

OTHER TRUCK CROP INSECTS.

Much good work was done with a number of other insects, including the onion thrips and the onion maggots, the melon aphid, several strawberry insects, and others. A notably good result was obtained in the case of the celery leaf-tier, since it was demonstrated that it could successfully be controlled by spraying with arsenate of lead at the rate of 1 pound to 50 gallons of water, the first spray to be made when the eggs are hatching and repeated every two weeks as long as the "worms" are to be found. This was accomplished at a cost, for labor and material, of \$2.35 per acre.

INVESTIGATIONS OF INSECTS AFFECTING FOREST RESOURCES.

The work in forest entomology has been continued during the past year under the direction, as before, of Dr. A. D. Hopkins. The results accomplished by this section of the bureau deserve especial mention and justify the expenditure of a larger sum of money in this direction.

WESTERN FIELD WORK.

An especial investigation of the insect damage to crude spruce products for airplane stock in the States of Washington and Oregon showed that the greater part if not all of the damage could be pre-

vented by proper methods of logging and production with little or no additional cost.

Exhaustive studies of insect investigation and control were continued in the Sequoia and Yosemite National Parks. Much new information has been gained, and the methods of gathering and compiling field data have been standardized.

A special study was completed on the interrelation of forest fires and insects on an area of about 8,000 acres in southern Oregon. This area had been under observation since 1914, and the fire had burned over about 800 acres in 1918. The records show that previous to the fire the insects had killed 485,000 board feet of timber. The fire killed 170,000 feet, and subsequently the slightly fire-injured as well as the uninjured trees in the burned area were killed by beetles, which were attracted from the surrounding areas. It was noticed that the infestation in the burned area increased more than 1,000 per cent, but it was found that the infestation in the surrounding areas decreased. It was also found that the broods of the beetles in the fire-scorched trees failed to develop to much beyond the original number that attacked the trees. So the fire did not contribute to an increase of the beetles in the general area or to the starting or extension of an epidemic of beetles. This result is of extreme interest and hardly to be expected.

The most careful study ever made of the history of an epidemic infestation by tree-killing beetles was completed and a report submitted during the year. In the Rogue River area in about 48,000 acres near Ashland, Oreg., the western pine beetle in 1914 caused the death of 346,000 board feet of pine timber. In 1915, 1,615,000 board feet were killed; 1,383,000 feet in 1916; and 608,000 in 1917. A count of the young and matured stages of the beetles that developed in an average foot of bark, and also of the number of exit holes through which the beetles emerged to attack other trees, showed that there was a notable decrease in numbers during the development of the broods each year in the infested trees on account of the increase of natural enemies and other disturbing factors. This helps explain why these beetle epidemics rise and fall within a limited period of years, and it explains how the western forests of yellow pine are naturally protected from total destruction. These facts are especially significant in connection with the application of the percentage principle of control, as by aiding the natural forces which work against the abnormal increase and spread of the beetles complete control may be gained. The history of this epidemic shows the importance of prompt recognition and prompt treatment of a threatened outbreak in order to prevent the great loss of timber which would occur before natural control became operative.

Another special study was made of the number of all stages of the western pine beetle in 330 square feet of infested bark selected from 67 trees, which represented an average infestation within an area of approximately 36 square miles. It was shown that there is a large percentage of mortality between the young and matured stages in the developing broods, but that normally an average of about 150 beetles to the square foot of bark developed to the adult, or reproductive, stage; which would be 50,000 beetles to the average infested tree, or, say, 39,000 beetles to 1,000 board feet of timber. Since it requires an average of about 10 beetles to the square foot to attack

and kill a vigorous, healthy tree, it will be seen that all the pine timber of the western forests would soon be destroyed were it not for natural and artificial control.

Experiments to determine the time of year to cut and the methods of handling mesquite for fuel, posts, etc., to avoid destruction by wood-boring insects, have been nearly completed, and the results show that serious loss in the Southwest can be prevented by cutting the trees in the late fall and early winter and piling the wood in loose piles until it is thoroughly dry. Damage to posts can be prevented by cutting them at any time and laying them on the ground where they will receive the full force of the sun, turning them occasionally so that the young stages of the borers will be killed by the heat.

Studies of damage to lead telephone cables in California by a wood-boring beetle have been continued, and the results so far show that the beetle is able to penetrate alloyed substances that are considerably harder than lead. The problem is still unsolved, and it will be difficult to find a practical means of controlling this pest, which is able to put hundreds of telephones out of commission by boring holes in the cables, through which the water enters, rendering the wire connections useless until the place is found and repaired.

EASTERN WORK.

Continued experiments with chemical substances applied to finished and crude forest products show that very few of the many substances that have been tried are effective, and, with crude products, none of them are so economical as simple and inexpensive management in logging and manufacture which will render the conditions of the bark and the wood unfavorable to attack.

Continued studies of termite, or white ant, damage to the wood-work of buildings has led to the discovery that one of the most destructive species can not live if deprived of moisture in ground or foundation timbers; thus it is possible to prevent serious damage.

Investigations of shade-tree insects have continued, and there has been much correspondence about insects of this class.

The recent appearance of the so-called seventeen-year locust, or periodical cicada, has given an opportunity for detailed study of certain points, and motion pictures have been made.

STUDIES OF THE BIOCLIMATIC LAW.

A law of latitude, longitude, and altitude as a guide to practice in fighting insects, and of value in the practice of agriculture, was first worked out by Dr. Hopkins, the chief of this section, in relation to forest and other injurious insects. It has proved, however, of such wide application that he has worked upon its various aspects with much assiduity. Extensive studies of the advance of the spring season were carried on over a large portion of the United States, and over 19,000 records of periodical events in plants and insects were made in the East. The most important result of this special study of the advance of spring is in the almost complete verification of evidence in support of the law that has been formulated from a preceding study of 40,000 records of reported dates of wheat harvest

and of records of altitude limits of life zones. Applications of this law appear to be of great value in the study of all problems relating to periodical farm practice, the warfare against insects among others.

TROPICAL AND SUBTROPICAL FRUIT INSECT INVESTIGATIONS.

This branch of the bureau's investigations is under the charge of the assistant chief of the Bureau, Mr. C. L. Marlatt,

INVESTIGATIONS OF INSECTS AFFECTING CITRUS FRUITS IN CALIFORNIA.—A considerable portion of the time of the investigators assigned to this project has been devoted to extension work in connection with the efforts to stimulate production as a war measure. The research work of this station has been continued with respect to the investigation of the availability of liquid hydrocyanic acid for the fumigation of citrus trees and the control of citrus mealybugs and the Argentine ant. For the purpose of experimentation with the liquid hydrocyanic acid, a 600-acre citrus ranch at Orange was placed at the disposal of the agents of this department, and very careful records have been kept on the subject of dosage, exposure, and effect of meteorological and soil conditions, and also of previous insecticidal treatments. Paralleling these orchard experiments, certain necessary physical and chemical examinations have been made of the liquid cyanid, involving the examination and analysis of over a hundred different samples to determine variation in the chemical composition and the causes of such variation, involving both methods of production and impurities. This investigation has resulted in the determination of proper dosage tables for effective use against the different scale insects infesting citrus trees under the different conditions outlined—tables which have been published and are now available and are being generally followed in orchard work in southern California.

The control of the Argentine ant, which has rapidly spread during the last few years in the citrus districts in California with the resultant large increase of damage by mealybugs, which it harbors and distributes, has been continued and a more efficient ant poison has been developed especially in its application to the dryer conditions of California. Demonstrations with this poison in the control of ants and the attendant mealybugs have been made at the various places in the principal citrus-producing counties of California. A method of control of the citrophilus mealybug, which has recently become a very serious pest in limited regions of the citrus belt of California, by banding and the use of ant poisons, has been developed which has resulted in one of the most notable successes in insect control done in the State. This method of control has practically eliminated this mealybug from upward of 500 acres near Upland, Calif., and, in fact, over most of the district infested by this insect, and for the first time in years the owners of these orchards are able to sell their fruit in prime condition at the highest market price. This method of control will be rapidly extended over the entire infested district.

In connection with the investigation of the two principal mealybug enemies of citrus plants in southern California, the parasitic and predatory enemies of these insects have been further investigated as also the symbiotic relations of these insects with the Argentine ant.

The department has cooperated with the California authorities in the determination of the best methods of exterminating the European snail (*Helix pisana*) which has become established in a small canyon or district near San Diego. As a result of this investigation and of various conferences the method of control now being carried out by the State is the burning over of the district with torches fed with oil under pressure totally to destroy the vegetation. This snail was possibly introduced by some foreigner familiar with its food value in Europe, without thought as to its tremendous possibility for harm to cultivated crops.

CITRUS FRUIT INSECTS IN FLORIDA.—The work under this project during the year has been largely limited to demonstrational work in the aid of increased production. Spraying demonstrations have been conducted widely throughout the State. A revised schedule for fumigation and treatment of trees to prevent insect injury has been worked out for the grapefruit, and a Farmers' Bulletin (No. 1011) has been issued entitled "The Woolly White Fly in Florida Citrus Groves." Some special lines of investigation have had to do with the stabilizing of insecticides especially where the only water available is obtained from deep wells containing a large percentage of mineral elements which more or less affect the stability of certain emulsions and other insecticides. The work in Florida has had particular relation to the citrus white fly, the rust mite, and the common Florida scale insects. The work in the control of citrus pests in Florida has shown the greater availability of liquid sprays over the fumigation methods commonly followed on the Pacific coast. During the last two years, however, considerable demonstration work has been done with fumigation in Florida by a private concern, the results of which have been carefully examined by the expert of this department as a protection to citrus growers and to determine that any claims made are fully justified.

INVESTIGATIONS OF INSECTS AFFECTING MANGO, GUAVA, AVOCADO, AND OTHER SUBTROPICAL FRUITS.—The mango and avocado and other fruits mentioned under this heading are being commercially developed on a considerable scale in southern Florida. A station has been established at Miami in cooperation with the Office of Foreign Seed and Plant Introduction of the Bureau of Plant Industry of this department to investigate the peculiar insect enemies of these fruits. Due to the proximity and commercial connections of southern Florida with Bermuda, the West Indian Islands, and Central America, this region is especially open to invasion by important fruit pests, and several of these have already gained entrance. One feature of the project, therefore, is to cooperate with the Federal Horticultural Board in safeguarding against further introductions of such insects from the sources named. The work of the last year under this station has had particular relation to several important insect enemies of the avocado. Already effective means of control of the principal avocado insects have been devised, notably with respect to leaf-infesting mites, to species of thrips, and several scale insects. Work has also been done with respect to insect enemies of the mango and the papaya.

STUDIES OF GREENHOUSE INSECTS.—Under this project, life-history studies and methods of controlling the chrysanthemum midge, a very important injurious insect of this plant in eastern greenhouses, have

been completed and presented for publication. A bulletin (Department Bulletin 778) has also been published during the year giving the life history and methods of controlling the rose midge. Work has also been done with respect to the effective utilization of various insecticides and in the general problem of fumigating plant houses.

MEDITERRANEAN FRUIT FLY AND MELON FLY.—This work is a continuing one, and has been carried on at the bureau's laboratory in Honolulu. The research features of the work have consisted in further studies of control by the agency of parasites and natural enemies. The principal work, however, has remained as heretofore in the inspection and certification of bananas, pineapples, taro, and coconuts for shipment from Hawaii to the mainland of the United States.

GEOGRAPHICAL DISTRIBUTION OF FRUIT FLIES.—The work under this project has for its special object the surveys of districts contiguous to the United States, from which the importation of fruit and plants may be the means of introduction of fruit flies and other enemies of important fruit crops. During the past fiscal year the field work under this project has involved explorations of the Panama Canal Zone, British Guiana, and the West Indian Islands of Barbados, Trinidad, Tobago, and Grenada, continuing the work which was done the previous year in Cuba, Jamaica, Dominican Republic, and the Virgin Islands. In the course of this work a great many insects have been collected and studied of known or potential economic importance and in addition a very considerable miscellaneous collection of insects has been made. The investigations were conducted in plant gardens maintained by the local departments of agriculture of the different islands and such general surveys as were possible within the time limits. Particular attention has been paid throughout the work to fruit flies, scale insects, and such other pests as are particularly likely to be carried from country to country by traffic in fruits and plants. A good portion of the time of the expert engaged in this work is necessarily devoted to the identification of the material collected and the working up of results.

INVESTIGATION OF FRUIT FLIES AND OTHER TROPICAL AND SUBTROPICAL FRUIT INSECTS IN THE CANAL ZONE, PANAMA.—This is a new project which has been established in cooperation with the authorities governing the Panama Canal Zone and the Federal Horticultural Board to study the important insects infesting tropical and subtropical fruits, cultures of which are being developed under the encouragement of the Government authorities in the zone. The importance of this investigation is due to the fact that the several important fruit flies and other tropical and subtropical fruit insects are now established in the zone, and to the further fact that the zone is more or less of a world's crossroads, i. e., a place where insect pests from remote places may be carried through the agency of commerce and easily gain lodgment, later, perhaps, to effect entry into the mainland cultures, tropical and subtropical, of the United States. This work, now in progress for one year, has developed useful information. Much work has been done in connection with the so-called black fly of citrus and other plants, which has become established in the Canal Zone and in the West Indies, and which a very determined effort is being made to exclude from the southern United States. A considerable number of other important injurious insects have al-

ready been discovered and have been the subject of studies. Among these are no less than four different kinds of fruit flies. There have been found in the Canal Zone also a number of insects which very injuriously affect commercial woods and wood structures. Termites are very important subtropical insects found in the Canal Zone. Several of these are abundant in the State of Panama and several have been found in the Canal Zone, some of which are very destructive to garden crops. The entrance of some of these into the United States would be followed by great injuries. The number of subjects which have been investigated at this station is already enormous, and a very convincing showing has been made of the need of keeping constantly in touch with the plant cultures and insect enemies in this district as a means of benefiting local production, but particularly as furnishing information on which any necessary protective action in the interests of the United States may be taken.

WORK ON THE GIPSY MOTH AND BROWN-TAIL MOTH.

This work has been continued under the supervision of Mr. A. F. Burgess, with headquarters at Melrose Highlands, Mass.

For the first time since the bureau began work to prevent the spread of these insects, it is possible to report a substantial decrease in the infested territory. This amounts to 1,824 square miles previously infested with the gipsy moth and 5,385 square miles by the brown-tail moth. Twenty-eight towns in New Hampshire, 6 in Vermont, 8 in Massachusetts, and 10 in Connecticut, 52 towns in all, were found to be free from gipsy moth infestation and were eliminated from the quarantine area this year. There is now under quarantine on account of the infestation by the gipsy moth 20,747 square miles in New England. Isolated colonies of the gipsy moth, which were found in previous years in New York, Ohio, New Jersey, and the western part of Massachusetts, have again been carefully examined but no infestation found. There seems to be no reasonable doubt that the insect has been exterminated in these colonies.

The decrease in area infested with the brown-tail moth includes 34 towns in Maine, 58 in New Hampshire, 6 in Vermont, 37 in Massachusetts, and 10 in Connecticut, a total of 145, embracing an area of 5,385 square miles which was released from quarantine this year. There are now quarantined on account of this insect 28,752 square miles.

FIELD CONTROL WORK.—The field work has been carried along on the same general lines as in previous years. As the scouting of the border area failed to reveal infestations in many towns, it was possible to devote more time and effort to the control of bad colonies located on exposed places in towns inside the border. Work of this character is exceedingly important, as it tends to reduce the opportunity for small caterpillars to be spread by the wind and helps to prevent new infestations from becoming established outside the border and in the area which has been cleaned. Scouting was carried on in 130 towns, and in a number of these towns the work was checked up by special scouts, known as trailers, to determine whether egg clusters were being missed. This method is constantly employed in order to keep the work on an efficient basis.

In the fall of 1918 several tons of gipsy moth banding material was prepared at the field storehouse at Franklin, N. H. About 4 tons of this material was applied to the trees early in the spring, and excellent results were secured. During the winter five of the horse-drawn spraying machines were converted into motor-propelled outfits and there were available 12 motor-truck sprayers and 7 horse-drawn machines, with the necessary hose, nozzles, and other accessories. These machines were distributed along the infested border and work was taken up as soon as the foliage was large enough to be sprayed. For the first time since the work began, dry arsenate of lead was used instead of paste. The results were satisfactory; and more of this material will be used in the future if the price is as favorable as is that of the paste form.

Spraying was carried on in 36 towns as follows: New Hampshire, 25; Massachusetts, 3; Rhode Island, 4; Connecticut, 4; 3,280 acres of infested woodland was sprayed; also 6,800 fruit and shade trees. This work in the border territory was greatly facilitated by the spraying carried on by the State entomologist in Connecticut. The work was arranged so that one motor truck furnished by the State and one horse-drawn sprayer treated the infestations in a number of towns.

PRESENT CONDITION OF THE AREAS INFESTED WITH THE GIPSY MOTH AND THE BROWN-TAIL MOTH.—The winter of 1917-18 was the most severe that has been experienced in New England for many years. Not only was the temperature abnormally low, but the snowfall was exceedingly heavy, except along the coast. These conditions were partly responsible for the failure of many gipsy moth eggs to hatch in the spring.

In the summer of 1918 serious defoliation by the gipsy moth existed in the Cape Cod region in Massachusetts, but small defoliated areas could be found in many other sections. Advantage was taken of this condition in planning the field work in the summer and fall of 1918, and, by taking advantage of the reduction in infestation in many localities, it was possible to clear many colonies.

The winter of 1918-19 was exceedingly mild and gipsy moth eggs survived and a very large proportion hatched.

Some of the parasites, particularly *Schedius*, which destroys gipsy moth eggs in the fall, were not nearly as numerous this year as heretofore, and the other introduced parasites do not appear to have fully recovered from the setback received during the previous winter. The wilt disease was also less abundant and effective this year than usual. As a result of these conditions heavy feeding by the gipsy moth has appeared over the greater part of the infested area in eastern Massachusetts and New Hampshire.

The present indications are that stripping will be more severe next summer, and if weather conditions are favorable for the spread of the small caterpillars by the wind next spring it will not be surprising if some of the recently cleared border towns become reinfested. The gipsy-moth problem is therefore more difficult than usual and the most strenuous measures will be necessary in order to hold the insect within the territory now infested until the parasites and diseases have become more numerous and effective in the worst infested regions.

The brown-tail moth appears to be on the increase in the eastern part of the territory, although special efforts were made by the State officials to clean up isolated infestations in the spring of 1919. Unless all colonies of this insect are thoroughly treated it is likely to increase its range.

SOUTHERN FIELD CROP INSECT INVESTIGATIONS.

The work of this class has been carried on, as before, under the direction of Dr. W. D. Hunter.

POISONING THE COTTON-BOLL WEEVIL.—In last year's report it was shown that one of the most striking achievements of the bureau which culminated during the year was the determination of the great value of powdered lead arsenate or calcium arsenate against the cotton-boll weevil. Large-scale experiments have been continued since that report. The methods and details of procedure of keeping the boll weevil in check by this method have been improved and thoroughly tested on a large scale. Cotton planters all over the weevil-infested portion of the cotton belt are taking up this method, and hundreds of individual inquiries in regard to it have been answered. The bureau is certain, however, that the exact methods which have been successful under conditions that exist in the Mississippi Delta will not be perfectly applicable to all portions of the cotton belt. Therefore, circulars have been issued regarding the general application and making it plain to planters that methods should be varied according to conditions. The weevil has been more numerous during the summer of 1919 than it was during the previous summer, and planters have therefore been more than ever desirous of trying this remedy. The bureau, therefore, has been especially anxious to guard them from mistakes.

An enlargement of this investigation seems necessary to bring about the best results. Experimental farms should be established in a dozen or more cotton-growing regions, and the very best method for each region must be worked out before planters can apply the remedy with confidence. The commercial results that have been reached already, however, in the delta region assure ultimate results of probably equal value in the other parts of the cotton belt after these comparative studies shall have been made.

OTHER COTTON INSECTS.—At the laboratory at Madison, Fla., a study of the Hemiptera attacking cotton east of the Mississippi River has been completed. At this station also a thorough study has been made of the varieties of sea-island cotton with especial reference to earliness of growth under boll-weevil conditions. Thirty-two varieties have been tested in this work. The importance of early fruiting of sea-island cotton under weevil conditions can not be overestimated. Careful studies at this point have also been made on the relation of the immature stages of the weevil to temperatures. The dry period in Florida, usually commencing about the 20th of May and extending to the 20th of June, seems to retard the weevil to such an extent that the problem of growing upland cotton under weevil conditions is very encouraging.

INSECTS AFFECTING SUGAR CANE.—The best hope for control of the moth borer of sugar cane now seems to be the importation and establishment of parasites which exist in Cuba. Experts were sent to Cuba

in the beginning of the fiscal year and again in April, 1919. Parasites have been imported, and every effort is being made to propagate them in the Louisiana cane fields.

TOBACCO INSECTS.—In Florida, promising control of the tobacco flea-beetle has been obtained with certain insecticides—an important result, as in 1918 one grower claimed a loss from this insect of \$650 per acre. Dusting methods in the shade-grown tobacco region have been revolutionized by the introduction of power machines which are capable of dusting from 10 to 20 acres per day more than can be done with hand dusters. For the tobacco thrips it has been found that nicotine sulphate, 14 ounces, and soap, 3 pounds, to 50 gallons of water, gives satisfactory control if applied properly once a week during the emergence period. A very important point is the time of application. Much valuable work has been done on other tobacco insects.

RICE INSECTS.—A Farmers' Bulletin treating of the principal insect enemies of the rice crop in the United States has been prepared for publication.

INSECTS AFFECTING THE HEALTH OF MAN AND ANIMALS.

In cooperation with the National Research Council and the Surgeon General's Office of the War Department, studies on the body louse were actively pursued during the year. This work resulted in the accumulation of much practical information concerning the value of the laundry processes, the dry-cleaning processes, and other means of control. A large number of chemical methods of treatment were also studied, and additional observation on the bionomics of lice was made. Many proprietary louse remedies were carefully tested, in cooperation with the Insecticide and Fungicide Board, thus protecting the Government against expenditures for worthless remedies.

An expert of the bureau has been assigned to work, in cooperation with the Public Health Service, on the problem of the species and habits of flies breeding in human excreta, especially in the open privies in rural communities of hookworm regions. The headquarters of this work are at Wilmington, N. C.

Several of the experts of the bureau were assigned to sanitary work in the Army, especially with relation to the insects that carry disease.

The work on insects affecting domestic animals has been considerably enlarged. Investigations of the biology, distribution, and methods of control of the ox warble were especially taken up, and important facts were gained in regard to biology. The work upon the screw worm was continued, as well as investigations of the horse-flies in eastern California and Nevada. Life histories of three of the more important species have been fairly well worked out. The lice of domestic animals have been studied from the remedial point of view, and methods of applying sodium fluorid to destroy chicken lice and pigeon lice have been perfected. Some supervision of certain packing establishments has been carried on in the effort to reduce the number of flies. This has been a continuation of previous work and is of much importance.

BEE CULTURE INVESTIGATIONS.

This work has continued under the supervision of Dr. E. F. Phillips. It has been chiefly a continuation of the campaign for increasing the honey crop, which was begun as a war measure. The educational activities then begun have been so eagerly received that they can not be discontinued, and it is still important that the enormous loss of ungathered nectar shall be reduced. During the year the apiary and laboratory were moved to a building in Somerset, Md.

DEMONSTRATIONS IN BEE CULTURE.—In addition to funds available under the regular appropriation, \$15,000, available from the food-production act, was used for demonstrations. The work was conducted as one project. As qualified men were found the number of agents was increased until there were in the field 16 men, working in cooperation with the several extension divisions of the 20 States to which they were assigned. Because of the great difficulty of finding competent men, it was possible to maintain an average force of only 12.

The work of these men was an effort to instruct beekeepers in better methods of production and care of their bees, so that the honey crop of the country might be increased. It will be desirable for many years to keep on increasing the production of honey, in order to conserve this natural resource which is now so generally wasted. There was also a great demand for honey for export to the allied countries, and this demand has continued since the cessation of hostilities.

During the fiscal year the field men, assisted from time to time by the regular office force, held over 1,000 meetings, attended by 25,000 beekeepers, and in addition they have visited over 2,500 apiaries and have given personal instruction to the owners regarding their beekeeping practices. The work of organizing the beekeepers into associations has been continued, and in several States these county organizations are being federated with the State beekeepers' organizations. There are now over 300 such county associations of beekeepers. During the year arrangements were made so that every man of the field force is assigned to a single State in cooperation with the extension divisions, both cooperating organizations paying part of the expense.

The meetings held by the field men must be limited in the topics discussed, and it is impossible to cover many important lines of work for lack of time. To overcome this difficulty a trial was made in the holding of extension short courses of a week's duration. The first of these schools was held in California during the year, and these were so successful, in spite of the severe influenza epidemic, that the same plan was later put in operation in New York, Indiana, Iowa, and Minnesota. The average attendance at these schools was about 100 beekeepers, who came for intensive instruction for a period of a week, and the work with these men during these schools leads to a strong belief that more good was done than could have been accomplished in the same time with shorter meetings even with a larger number in attendance. These schools are planned for commercial beekeepers. The instruction was on fundamental problems of the beekeepers, no attention being given to the mere simple mechanical operations, but emphasis was placed on the reasons for various practices as based on the behavior of the bees. In every

State where the work was given the beekeepers and extension officials have asked that similar schools be held in the future, and other States have asked for schools.

A bulletin on commercial comb-honey production (Farmers' Bulletin 1039) was issued during the year. It is a revision of Farmers' Bulletin 503. A bulletin on swarm control is in process of preparation, and one on extracted honey production. When these bulletins are issued it is planned to publish a bulletin on beginning beekeeping, and then to discontinue the present general bulletin on beekeeping (Farmers' Bulletin 447) and to replace it with one which will serve to tie together the various technical bulletins on special topics.

WINTERING OF BEES.—Little work has been done during the year on the investigational phases of this problem, because the field men have been necessarily occupied with purely practical work and the office force with answering requests for information sent in by beekeepers, but observations have been continued which fully substantiate the results of the more detailed work. During the year two bulletins of a practical nature were published—Farmers' Bulletin 1012, on the care of bees when wintered outdoors, and Farmers' Bulletin 1014, on wintering bees in cellars. These bulletins give explicit directions for the care of bees during the winter season and contain recommendations applicable to the entire country. It is gratifying to report that beekeepers throughout the country are paying more attention to the careful wintering of their bees since the bureau took up this subject for investigation.

DISEASES OF BEES.—During the year a paper (Department Bulletin 780) was published on Nosema disease, a malady of adult bees which may at times cause some loss. A bulletin (Farmers' Bulletin 975) was issued on the preventive and remedial measures to be employed against European foulbrood, and in this bulletin for the first time detailed attention is given to the factors which may successfully be used by the beekeeper to prevent the inroads of this disease. Papers on the etiology of American foulbrood and European foulbrood were also prepared, and a paper on the behavior of bees in the cleaning out of European foulbrood, a phase of investigation which had previously been neglected, but one which now promises to yield most important results from the standpoint of control of the disease. An investigation was made of the peculiar manifestations of European foulbrood in California, where, because of the climatic conditions and the character and time of the honey flow, and perhaps especially because of the methods of beekeeping employed, the disease is unusually destructive and shows characteristics not often encountered elsewhere. During the year 563 samples were received from apiary inspectors and from beekeepers for diagnosis.

EFFECT OF THE WAR ON BEEKEEPING.

In the last annual report attention was called to the effects that the war had on the beekeeping industry. The increased demand for honey for export has continued ever since the cessation of hostilities and there is reason to expect that this market will continue to be an important factor in American beekeeping. During the period of severe sugar shortage, the home consumption of honey was greatly increased, but beekeepers were worried for fear that when sugar

became plentiful this demand would cease. If beekeepers are able to produce enough honey to meet this increased and increasing demand this enlarged home consumption will continue. The local sales of honey, near the points of production, increased more rapidly than sales in the larger markets, but this can readily be remedied by the further development of the larger bottling trade in honey for which there is demand.

After the winter loss in the white clover region during the winter 1917-18, the beekeepers of this region found themselves short of bees in the spring of 1918, just at a time when there was the greatest opportunity to build up their business. This produced a great demand for bees in combless packages from the Southern States and resulted in the building up of a large business of this character, which will continue and will be an important factor in beekeeping in the future. The supply of bees from the South in 1918 probably did not fully replace the winter loss during the summer of 1918, but because of the increase made by beekeepers there are probably more bees in the important clover region than ever before. The demand for queenbees to be furnished by professional queen breeders was so great during the spring of 1919 that practically all of them had more orders by May 1 than they could fill during the entire summer. In the West, where the loss of bees was not unusual, there has been even a greater increase in the holdings of the larger beekeepers, resulting in a greater difference between the commercial holdings and the bees in the hands of amateur beekeepers. The tendency to collect the bees of the country in the hands of commercial beekeepers is a most wholesome sign for the proper development of the beekeeping industry for the future, and the war's net result on beekeeping will be an increase in the commercial aspect of the business. The increase of commercial beekeeping has greatly increased the demand for assistance to beekeepers and has made them eager to accept the extension activities of the office. The correspondence of the office is now twice what it was before the entrance of the United States into the war. The demand for beekeepers' supplies and for literature on beekeeping has been greater than ever before in the history of beekeeping in the country.

In explanation of the desirability of making the beekeeping industry one which is in the hands of professional beekeepers rather than to urge the keeping of bees on every farm, it may be stated that the prevalence of the two destructive brood diseases throughout the country, and especially the necessity of careful study of beekeeping problems in order to obtain the maximum crop, make it almost impossible for the person having only a few colonies to give the care to the bees which will result in good beekeeping. Only the man who makes this his chief work may expect to get the returns which are obtained from colonies properly cared for.

GENERAL SUMMARY OF THE WAR ACTIVITIES OF THE BUREAU.

(1) A very perfect system of reporting insect outbreaks was organized, the result of which was a close knowledge of the exact conditions almost from day to day of insect-pest increase over the whole United States. These conditions were made known to all of the economic entomologists of the country through circular let-

ters, and by cooperation based upon this intimate knowledge crop pests were held in check and food production greatly helped.

(2) By conferences with the chemists and the insecticide manufacturers the problem of the reduced quantity of arsenic (on account of its use in munitions) was met, and by conservative use and better distribution the supply was made to cover the needs of the farmers, fruit growers, gardeners, and others.

(3) The bureau assisted the Quartermaster General's Department of the Army by inspecting the enormous quantities of grain and other material intended for shipment to Europe and gave advice as to fumigation and other treatment when such stored products were found to be infested with insects. It also inspected warehouses and mills in the same way in many parts of the country.

(4) Advice was given to representatives of the War and Navy Departments and the Shipping Board relative to insect damage to lumber and stored wooden implements.

(5) By the efforts of the beekeeping section of the bureau the beekeepers of the country were aroused to the necessity of a great increase in honey, owing to the shortage of sugar. Specialists were sent out, held meetings, addressed more than 25,000 beekeepers, visited the apiaries, and gave personal instruction, with the result that the honey crop was greatly increased. Our exports of honey to allied countries increased at least ten times over those of any period previous to the war, and the domestic consumption of honey also greatly increased.

(6) In medical entomology the bureau maintained a thorough cooperation with the Office of the Surgeon General of the Army in the matter of experimental work on insect problems. All insect remedies reported to the Medical Department of the Army were referred to the bureau for opinion or for test. The most extensive work was done on the subject of the body louse, and branch laboratories were established for experimental tests. Experts of the bureau were in several cases engaged for special work in concentration camps against insects carrying disease, and at the close of the war one of these experts, who had early entered the Army as a reserve officer, had virtual charge of the great delousing plant at Camp Mills, through which troops returning from Europe were passed.

The foregoing six paragraphs include only the broadest outline of the work which, were it to be stated in more detail, would indicate that in very many directions the bureau's services were most important.

REPORT OF CHIEF OF BUREAU OF BIOLOGICAL SURVEY.

E. W. NELSON, *Chief of Bureau.*

ECONOMIC INVESTIGATIONS.

Largely increased war emergency funds were added to the regular appropriation during this fiscal year for the campaign against predatory animals and injurious rodents. As a result, the work was more

thoroughly organized and was conducted on a greater scale than during any previous year. The Federal funds available for this purpose amounted to \$592,000. To this was added a total of more than \$800,000 by States, counties, farmers and stock-growers' organizations, and individuals, in funds expended in cooperation with, and mainly under the direct guidance of, the Biological Survey. In addition to these funds, much material and the personal services of many thousands of farmers and stock growers were contributed to the field work, in assisting to destroy animal pests both on private lands and on Government lands adjacent to private holdings. In North Dakota about 42,000 farmers joined in the work and in Montana about 18,000. In other States cooperation was general and involved large numbers of men.

During the early part of 1919 the legislatures of Arizona, Colorado, Idaho, Nevada, New Mexico, North Dakota, Montana, Oregon, California, Texas, Utah, and Washington made direct appropriations amounting to \$688,000 to be expended in this work during the two following years in cooperation with the Biological Survey.

Wherever work has been undertaken the rapid growth of cooperative funds and the increase in the number of men participating furnish a practical demonstration of its success and usefulness. The bureau is in constant receipt of urgent requests for additional help far beyond the limits set by its available funds.

Estimates based on information supplied by farmers and stockmen indicate that the destruction of more than 32,000 predatory animals under the direction of the Biological Survey during the year resulted in a saving of live stock valued at approximately \$5,000,000; and the destruction of prairie dogs and other rodents resulted in a saving of enormous quantities of forage, and also of crops valued at not less than \$14,000,000.

PREDATORY ANIMALS AND RABIES.

Of the total funds available for the campaign against injurious animals, about \$375,000 was provided for use in destroying wolves, coyotes, mountain lions, bobcats, and other stock-killing animals and for the suppression of wild animals affected with rabies. For the prosecution of this work, which began in 1915, the Western States have been organized into 10 districts, each with a trained inspector in charge, as follows: (1) Arizona, (2) California-Nevada, (3) Colorado, (4) Idaho, (5) New Mexico, (6) Montana, (7) Oregon-Washington, (8) Texas, (9) Utah, (10) Wyoming-South Dakota.

During the year a force of from 400 to 500 skilled hunters has been employed under the direction of the various inspectors. The salaries of a part of the hunters are paid from the Federal Treasury and of the others from cooperative funds supplied by the States or by contributions from local organizations and individuals. As heretofore, the hunters are not permitted to receive bounties, and the skins taken by each become the property of the Federal Government, the State, or the organization or individual providing the money for salary. Skins taken by Federal hunters during the year netted the Federal Government \$76,128.56, which has been turned into the United States Treasury, making the total received by the Government from this source to date \$197,387.37.

The number of skins or scalps of predatory animals taken by official hunters during the year is as follows: Wolves, 584; coyotes, 27,100; mountain lions, 149; bobcats, 4,123; Canada lynxes, 43; bears, 81. In addition, as a result of poisonous operations, so many dead coyotes are reported by stock growers to have been found on the ranges where poisoning operations were conducted that it is safe to estimate the number destroyed in this way as more than equaling the approximately 32,000 predatory animals of which the skins and scalps were taken.

Predatory-animal hunters are directed to consider bears under ordinary circumstances as game animals and have positive instructions to take every precaution not to kill any except those known to be destructive to live stock. Unfortunately, occasional unoffending bears are taken in traps set for other animals, thus making the number of bears killed during the year considerably larger than would otherwise be the case. The vast majority of bears are inoffensive so far as injury to stock is concerned, but occasional individuals in all parts of the range country become stock killers, some of them being notoriously cunning and destructive in their activities. Naturally such animals must be eliminated, and the more promptly this is done the less prejudice there is likely to be created among the stock growers against all bears.

From much expert study and experimentation, great improvements in methods of poisoning predatory animals have resulted. Larger and more thoroughly organized poisoning campaigns than ever before attempted were conducted during the year. Their success was such that in many areas stock growers are urging the extension of this method as being the most practicable one for the control of coyotes. Extended poisoning operations were conducted in the great sheep-growing sections in Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming. This was followed by a marked decrease in the number of coyotes in the sections poisoned, with a corresponding decrease in the losses of sheep, cattle, pigs, colts, and poultry. Reports have been received from stockmen stating that on many important ranges and lambing grounds the former heavy annual losses have become negligible or have been entirely eliminated.

For a number of years rabies has been prevalent among predatory animals in California, Idaho, Nevada, Oregon, Washington, and Utah. A part of the money available for predatory-animal control has been appropriated for the specific purpose of destroying the wild animals affected with this disease in the States named. Although the disease still maintains a foothold in all of these States, efforts in suppressing its carriers have been so successful that its spread to other States has been prevented, and the number of domestic animals and persons bitten by rabid wild animals has steadily decreased until at present the number is very small. When an outbreak of the disease occurs in any district, hunters are immediately concentrated there, so that the wild animals carrying the rabies are summarily destroyed and the spread of the disease is promptly stopped.

The serious situation resulting from the outbreak of rabies before it was controlled is indicated by the fact that in the fiscal year 1915-16, when the principal outbreak in Nevada occurred, it was estimated that live stock in that State valued at about \$500,000

were lost through being bitten by rabid animals. Some ranches lost from 200 to 400 head of cattle. Up to the present time approximately 1,500 persons are known to have been bitten by rabid animals and treated for the disease, and at least 47 are known to have died from it. Without Federal intervention for the suppression of rabies, the ravages brought about by it would have been vastly increased. Furthermore, it should be borne in mind that with the disease still persistent in scattered localities throughout the territory where it was once generally prevalent, the removal of organized preventive measures would at once result in its renewal and spread throughout the western range States.

Special efforts are being made by inspectors of the bureau to destroy individual predatory animals which have become notorious for their stock-killing exploits in various States. Near Dubois, Wyo., a mountain lion was killed in the spring of 1919 which was known to have destroyed \$1,000 worth of live stock last October and to have killed a number of cattle during the winter. This was a much-hunted and battle-scarred animal which had been wounded a number of times by private hunters. Another mountain lion taken in April had killed seven colts during the spring. In the same State a pair of wolves were killed—the female by a Government hunter and the male by a private hunter—which had destroyed more than \$2,500 worth of stock during the preceding year. The owner of a ranch near Mertzon, Tex., reported that in less than three months his losses amounted to nearly 300 sheep, valued at \$3,200, caused by 6 coyotes which one of our hunters captured during July. In western Colorado, in an area about 75 miles in diameter which was poisoned two successive years, through cooperation between local stock growers and the bureau, sheep owners reported formerly a loss of about 25 sheep a day throughout the season, but the destruction of predatory animals has been so thorough that at present the losses are nominal, and sheep are reported to range freely, sometimes unattended for several days in succession, without loss. In New Mexico the wolves, which were estimated to number between 300 and 400 at the time the campaign began there, have been reduced to less than 30 individuals, and this number is being steadily decreased by the persistent campaign against them. These remaining wolves are mainly experienced adults, causing annual losses of live stock amounting to about \$2,000 each. In southern New Mexico the stock of wolves is constantly renewed by stragglers from the mountains of northern Chihuahua. In addition to the ravages from the native predatory animals, live stock in parts of Texas, Arizona, and other States suffer from depredations by dogs which have gone wild and have taken up the predatory life of wolves. In some places the dogs join the wolves, and the half-breed offspring increase the packs.

RODENT CONTROL.

As in the previous fiscal years, the war emergency need for increasing the food output caused the bureau to concentrate its campaign against injurious rodents about farm areas. As heretofore, the effectiveness of this work was greatly increased by the cooperation of the States Relations Service of the Department of Agriculture and of the extension services of State agricultural colleges.

The county-agent organization of the latter, in greatly enlarging the educational campaign, brought about a public appreciation of the enormous losses from the depredations of rodents and secured the cooperation of the farmers on a large scale. As a consequence the most vigorous and successful drive yet made was conducted against the myriads of prairie dogs, jack rabbits, field mice, and other rodent pests which seriously decreased the output of grain, alfalfa fields, and orchards and lessened the value of truck and garden crops, as well as of forage on the stock ranges throughout the West.

Cooperative campaigns with local organizations and individuals were conducted in Arizona, California, Colorado, Georgia, Idaho, Kansas, Maryland, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, and Wyoming. Preliminary conferences were held in reference to the organization of similar work in Iowa, Minnesota, and Texas. Investigations for bettering the methods of destroying injurious rodents as well as improving the organization are being conducted, and the work is becoming increasingly effective.

Field investigations through inclosed trial plots for the purpose of securing accurate data as to the destruction of forage by rodents on the open range have been continued during the year in cooperation with the Forest Service, the State University of Arizona, and the Carnegie Institution of Washington. Interesting and valuable results are being secured.

The demands from the States for increased activities in rodent-control work, and the money offered by States and counties for cooperative purposes, are far greater than the bureau can possibly meet with its available funds. The opportunity for useful expansion in this work is obvious in view of the fact that native rodents destroy each year field crops and forage worth approximately \$300,000,000, while the losses from house rats and mice approximate nearly \$200,000,000, a large proportion of which can be eliminated at moderate cost.

Through a system of contracts the bureau has been able to assist the States in securing poison supplies for use in rodent campaigns at a discount amounting to many thousands of dollars, thus increasing the effective use of their funds.

PRAIRIE DOGS.

Prairie dogs occupy more than 100,000,000 acres of public and private lands. Wherever they occur in abundance they are exceedingly destructive to cultivated crops and to forage on the open range. In cooperation with the extension services of the agricultural colleges in Arizona, Colorado, Montana, New Mexico, North Dakota, Oklahoma, South Dakota, Utah, and Wyoming, the campaign against these animals has been pushed aggressively. In Arizona and New Mexico the State councils of defense joined actively in the work and contributed funds for the purpose. The participation of farmers and stockmen has been fuller than ever before, and the saving of crops and forage has been correspondingly great. During the year from 75 to 95 per cent of the prairie dogs were destroyed on nearly 2,000,000 acres of privately owned crop and forage lands and on more than 200,000 acres of public domain, the latter making more

than 3,700,000 acres of public lands which have been largely freed from these pests. In many places private landowners were so interested that they volunteered their services to clear adjacent Government lands, the bureau supplying the poison to be used in the work. With cooperation of this character it will be possible to clear large areas of the public domain at almost a nominal cost to the Government.

GROUND SQUIRRELS.

Numerous species of ground squirrels occur in the West, several of them having such wide ranges and existing in such abundance that their depredations on crops and forage are most serious. As with the prairie dogs, continued investigations are being made to devise improved methods of poisoning and of organization for their destruction. The poisoned grain used for operations against ground squirrels on private lands is prepared under the supervision of field representatives of the bureau and furnished cooperating farmers at cost through local organizations. In this way 1,349 tons of poisoned grain were prepared and distributed during the year, and nearly 110,000 farmers took part in the campaign.

Through the plan inaugurated by the bureau of cooperative purchase of poison supplies the saving in the squirrel campaign, as well as in the destruction of other rodents, has been very great, as illustrated in Idaho, where it amounted to about \$18,500.

During the year ground squirrels were poisoned and mostly destroyed on more than 1,294,000 acres of public domain and on more than 13,465,000 acres of private lands. This resulted in materially increasing the percentage of crops harvested in all the States where work was conducted and in increasing the forage output on the public domain.

JACK RABBITS AND COTTONTAILS.

As in previous years, work was done to control the losses of crops, including wheat, barley, oats, beans, alfalfa, and others, from jack rabbits, particularly in Arizona, Idaho, Nevada, New Mexico, Oregon, Utah, and Washington. Wherever market and other conditions were favorable, jack rabbits were killed by drives and by trapping in order that they might be sold for food. In this way two counties in Utah, under the direction of a representative of the bureau, marketed 6,500 of these animals, besides the large numbers marketed independently. Effort is being made to develop the utilization of the meat and skins of these animals through standardized methods of dressing and marketing. In many places where it was impracticable to kill jack rabbits for market purposes extended poisoning operations were conducted, as in Idaho, where in this way 40,000 of these animals were killed in one county.

In addition to damage by jack rabbits, complaints have been received by the bureau of depredations by cottontails among fruit trees, and in truck and other agricultural crops. Complaints of losses from this source have been more numerous from the Eastern States, where demonstrations have been given to teach farmers the most practicable means of protecting their crops from these animals.

POCKET GOPHERS.

Pocket gophers are exceedingly injurious to root crops, peanuts, beans, alfalfa, hay meadows, grazing lands, and orchards. The seriousness of their depredations is indicated by an estimate made by a competent official of the Kansas Agricultural College that during 1918 they destroyed one-tenth of the alfalfa crop in that State. The alfalfa crop of Kansas for that year was valued at \$50,000,000, so that the damage by pocket gophers to this crop alone amounted to about \$5,000,000. In view of the fact that these animals also do extensive damage to orchard and other crops, the injurious character of this pest is evident. Pocket gophers have a wide distribution in practically all of the States from the Mississippi River to the Pacific coast. On some of the most productive grazing lands on the national forests they seriously reduce the forage production. Methods of destroying these animals adapted to use in extensive community campaigns have been much improved during the year.

Pocket gophers not only damage established crops, but frequently interfere with the introduction of new and valuable crops. This was well illustrated at Hearne, Tex., where the quarantine against the pink cotton boll worm prevented the growing of cotton. The State agricultural college planned to foster the planting of peanuts as an important food and feed crop, but this was found to be impracticable on account of the abundance of pocket gophers. At the request of the agricultural college, an experienced representative of the Biological Survey was detailed to assist in organizing a community campaign against these animals. Farmers and business men joined heartily in the work, with the result that every pocket gopher in the area treated was reported killed, and an excellent crop of peanuts was planted and harvested.

MOUNTAIN BEAVERS AND WOODCHUCKS.

The investigations were continued into the habits of the mountain beaver, or sewellel, a curious rodent living in the humid region of the Northwest coast. With the development of agriculture in its region this animal, which was formerly considered harmless, has become increasingly injurious to crops, particularly to small fruits and to market produce. Methods for its control have been devised, and demonstrations were made by a representative of the bureau in various localities in Washington and Oregon where there was need for the adoption of active measures.

Woodchucks have continued to be a source of annoyance and loss to gardeners and truck growers throughout the northern and northwestern sections of the country. In many parts of the Northwest the planting of alfalfa and clover and of other succulent crops has attracted the attention of woodchucks, which have concentrated about these new sources of food supply, with attendant losses to the farmer. In some of the Northwestern States where the woodchucks live in the rocks adjacent to cultivated fields, strips of alfalfa and clover several hundred feet wide along the borders are often completely destroyed. It was found that the methods of destroying these animals used successfully in places where they live in burrows in the open country were not effective in this region. Successful methods were here developed, however, and as many as 55 woodchucks have been killed in a single field demonstration.

NATIVE MICE, WOOD RATS, AND COTTON RATS.

Widespread damage to orchards by the depredations of native mice continue to be reported, the most conspicuous occurring in the States of Virginia and Washington. In Winchester County, Va., the loss is reported of more than \$200,000 by pine mice, which gnaw the bark from the roots of orchard trees. Demonstrations have been given for the control of these pests.

In Florida surprisingly successful experimental plantings of sugar cane on a considerable scale have been made within the last two years, but during the year reports have been received of extensive damage to the cane by rodents which destroy the seed cane and cut the growing stalks. So serious has been this damage that the principal company interested in the development of the sugar-cane industry in that State has written the bureau that unless some method can be found for successfully controlling the cane-destroying rodents the development of the industry there will be impossible. Losses of from 40 to 60 per cent of the growing cane have been reported. The depredations are by the cotton rat, a small ratlike rodent limited to the South Atlantic and Gulf States. Investigation has determined effective methods of poisoning these rodents, and it is believed that through demonstrations and advice the growers will be able to control the rats and reduce the losses to a negligible amount.

Wood rats continue to be troublesome in limited areas, and where they become especially injurious demonstrations and advice have been given for their control.

HOUSE RATS AND MICE.

The extended educational campaign inaugurated last year was continued in order to acquaint the public with the serious drain on the Nation's food resources through depredations of house rats. Demonstrations were given of methods of poisoning and trapping the animals, and plans for community organization against them were presented and discussed. As a result many State officials, State councils of defense, and public-spirited citizens took up the work of organizing campaigns, and great numbers of the rodents were destroyed.

Requests were made by military and naval officers in charge of camps, arsenals, and storage warehouses in this country for advice and assistance in controlling house rats in the buildings under their control. Experienced representatives were detailed to investigate conditions and recommend plans for limiting the losses. Gratifying results were obtained, perhaps the most important of which was at the Bush Terminal warehouses in Brooklyn, N. Y. These great warehouses were taken over by the Government for Army quartermaster storehouses, and were so badly infested by rats as seriously to endanger the stored food and other Army supplies. At the request of the quartermaster officer in charge, a representative of the bureau made a survey of the warehouses in January, 1918, and recommended a method of procedure for controlling the rats. At the end of the year the quartermaster officer in charge advised that the recommendations of the bureau had been followed with complete success. He reported that at first practically a barrelful of rats were killed each day, and that more than 35,000 rats were

killed during the year. The work of destruction was so thorough that he reports the losses of military supplies during the entire year to have been negligible.

Large numbers of the Farmers' Bulletin (No. 896) giving information concerning the destruction of rats were used in this country by the Quartermaster Department of the Army and also in France in an effort to control losses from these animals.

In this connection it may be stated that several experts in rodent control who were commissioned in the Sanitary Corps of the American Expeditionary Forces in France for the purpose of controlling the depredations of rats in connection with the Army operations, were highly successful in preventing heavy losses of quartermaster stores from these rodents.

MOLES.

Throughout the year demonstrations were continued in Washington and Oregon for the control of the large moles which are a serious pest to agriculture in that region. The fur value of these animals having been established among fur dealers through the efforts of the Biological Survey, the price of their skins continues to advance. In cooperation with extension services and other agricultural agencies in their territory, demonstrations of methods for capturing the animals and preparing their pelts for market were continued. Successful boys' and girls' clubs were organized to trap them and to cooperate in selling the skins. As a result the members of the clubs learned a valuable lesson in cooperative work, not only in ridding fields of a pest, but also in marketing, the sale of the skins netting them the substantial sum of more than \$50,000.

DOMESTIC RABBITS.

The high cost of meat during the war and the scarcity of rabbit skins for manufacturing felt hats and cheap grades of furs combined in emphasizing the opportunity in this country for the profitable production of rabbits. In Europe the growing of domestic rabbits has long been an industry of considerable importance conducted on a small scale by numberless individuals, and it has already been abundantly proved that domestic rabbits do equally well in the United States. Not only is their meat of excellent quality, but their fur is of value also; recently these furs have been manufactured on a considerable scale, dyed and in their natural colors, and are frequently most attractive in appearance.

Under ordinary conditions the rearing of domestic rabbits will give a quick and economical supply of meat, one that can be produced cheaper than that of the domestic fowl; while the skins of selected stock are of sufficient value to render them an important part of the returns. A growing interest has been shown in the bulletins and other publicity from this bureau designed to encourage the growing of these animals on farms and in back yards. National and State rabbit breeders' associations are now well established; clubs and associations are being organized and periodicals developed to increase rabbit growing; and many boys' and girls' clubs have taken up the enterprise. It is believed that through these methods a great increase in the development of this young industry may be brought about.

With a view to fostering the production of these animals along practical lines investigations have been continued among the breeders of the country and among those dealing in the skins and manufacturing the furs. An article on rabbit growing to supplement the meat supply was published in the Yearbook of the Department for 1918, and a bulletin is now in process of preparation to supersede the Farmers' Bulletin (No. 496) on "Raising Belgian Hares and Other Rabbits."

FUR-BEARING ANIMALS.

Investigations concerning fur-bearing animals have been continued and the annual bulletin on laws relating to these animals was issued. The animals now held at the experimental fur farm in Essex County, N. Y., include minks, martens, fishers, skunks, raccoons, and rabbits. Experiments in inclosures for these animals, as well as in feeding and breeding them, and investigations concerning the parasites and diseases to which they are subject, are in progress. Two graded Saanen goats have been furnished by the Bureau of Animal Industry for use at the farm to provide milk for feeding the fur animals and to keep down weeds in the animal yards. Domestic rabbits are also being grown at the farm in order to supply the fur bearers, especially the breeding females, with fresh meat. The keeping of a few domestic animals at the fur farm has necessitated a limited amount of farming there to produce feed in the form of hay, oats, buckwheat, corn, carrots, and turnips. A building to shelter the rabbits and goats and to store feed for them has been completed during the year, and ground has been cleared and material assembled to build yards to accommodate four pairs of cross foxes.

An inquiry concerning the supply of furs from wild fur-bearing animals has been addressed to a large number of raw-fur dealers throughout the United States, including Alaska. This has developed the fact that there has been an alarming reduction in the number of skins coming to the market during the last decade, and that there is a general demand for short open seasons on fur-bearing animals, and particularly for better enforcement of State laws against trapping fur-bearing animals when their fur is not prime.

Most States now have laws protecting fur bearers during at least a part of the year. Up to within a recent time most of the fur bearers, including such species as the skunk and the mink, have been considered pests, because they at times raid chicken coops. The apparently infrequent damage done by these animals is negligible as against their great value. The skunk feeds largely on field mice and insects and has become one of our most valuable fur bearers. The Commissioner of Conservation of New York reports that during 1918 skunk skins taken in that State brought more than \$1,000,000 in the fur market. There is no State in the country which can not greatly increase the natural resources represented by its fur-bearing animals by proper protective laws and their enforcement.

ECONOMIC ORNITHOLOGY.

Article VII of the migratory-bird treaty between Great Britain and the United States reads as follows:

Permits to kill any of the above-named birds which, under extraordinary conditions, may become seriously injurious to the agricultural or other in-

terests in any particular community, may be issued by the proper authorities of the High Contracting Powers under suitable regulations prescribed therefor by them, respectively, but such permits shall lapse, or may be canceled at any time when, in the opinion of said authorities, the particular exigency has passed, and no birds killed under this article shall be shipped, sold, or offered for sale.

The administration of the act of enforcing the treaty as a consequence of this article has caused a notable increase in the demand for economic ornithological work. Numerous reports of bird depredations have been made, and in some of the cases investigated recommendations for the control of the species have been made, while in others the complaints proved to be without basis to warrant action. The incentive for large crop production incident to the war has been an added cause for the receipt of more than the ordinary number of complaints concerning bird depredations. - A policy of bird conservation that will best serve the interests of the farmer involves not only a thorough appreciation of the value of beneficial species, but adequate attention to the control of troublesome ones. Consequently, now that the beneficial species are fortified by ample protective legislation, the importance of perfecting methods for protecting crops against damage by birds becomes apparent.

FISH-EATING BIRDS.

Continuing the work started last year in investigating the food habits of fish-eating birds, field work was conducted in Florida to ascertain the relation of pelicans to the fishing industry. Claims had been made that these birds were responsible for the reduction in the numbers of mullet noted in recent years, as well as for the destruction of other food fishes. It naturally followed that the protection of the brown pelican in the breeding colonies, which are maintained as bird reservations, was criticized. The habit of young pelicans, in common with some of the other fish eaters, of regurgitating their food when disturbed, permitted the examination of the stomach contents of several hundred of them without killing a bird. Of the 814 fish found in the material examined only 9 (7 mullet and 2 red fish) were of species valuable as human food. By far the largest item, comprising over 91 per cent of the food, consisted of menhaden, a nonfood fish occurring in great abundance in the shallow waters about Florida and along the Gulf coast. Adult pelicans, however, are at times a nuisance about gill nets, where, in their attempts to secure the enmeshed fish, they tear the seines.

Reports of destruction of trout by mergansers, or fish ducks, in Michigan were investigated, but the mildness of the past winter presented conditions tending to keep these birds out of the smaller streams where the damage is usually done. This matter must be investigated under more nearly normal winter conditions to determine accurately the amount of loss from this source. A report on the economic status of all our fish-eating birds is nearly ready for publication.

NIGHT HERONS IN LOUISIANA.

In Louisiana the night herons had been charged with being a menace to the frogging industry, and for that reason permission was asked to shoot them, as had been done prior to the enactment of the migratory-bird treaty act. Louisiana is the only State wherein night

herons had ever been widely considered as legitimate game and a source of food. Among the French-speaking people of some sections the young of these birds are considered a great delicacy, and "gros-bec" hunting has been a favorite sport in the cypress swamps of La Fourche, Terrebonne, St. Marys, and neighboring parishes. An expert made a careful study of the birds in their haunts and after examination of a large number of stomachs reported that these birds are in no way a detriment to the frogging industry. It was proved that more than 96 per cent of the food in the stomachs of the night herons examined consisted of crawfish, and not a single frog was found. These birds were mainly the yellow-crowned species (*Nyctanassa violacea*), but previous examinations of stomachs of the black-crowned night herons showed that they had similar habits.

WHITE-WINGED DOVES IN ARIZONA.

Complaints by grain raisers of Arizona against the white-winged dove also necessitated investigation, chiefly in Maricopa County, where about 30,000 acres of wheat and barley had been planted. It was found that the doves were very abundant and that by far the greater part of their food was secured from the waste grain dropped among the stubble. The birds seemed to prefer feeding there even though shocks or stacks of grain remained in the same field. In small fields, especially those located near large breeding or roosting colonies, the damage is sometimes very serious. In such situations it will probably be necessary to permit the killing of birds actually damaging crops.

BLACKBIRDS IN OHIO.

A study of the food habits of red-winged blackbirds in northeastern Ohio, where sweet corn is grown extensively, determined the fact that these birds are a menace to the crop. The damage is of a most annoying character, as the attacks are made when the crop is nearly ready to harvest. The birds tear open the husks and feed on the terminal kernels, thus making the corn unsalable. Field corn also is similarly damaged. Effective control measures were devised for fields of small size and for garden patches, but for large areas more economical measures must yet be discovered. It has been found that with care and with proper baits strychnine may be used against blackbirds with very little danger to other wild or domestic bird life.

BOBOLINKS, OR "RICE BIRDS," AND THE RICE CROP.

A complaint coming from the lower Delaware Valley regarding depredations by bobolinks, "reedbirds," or "rice birds," was investigated and found to be without foundation, but a continuation of this investigation in the South Atlantic States indicated that these birds are as destructive to rice as ever wherever opportunity offers. On their northward migration they do great damage to newly-sprouted rice and on their southward journey they raise havoc with rice in the milk. Untold thousands of these birds swarm in dense clouds over rice fields, where they may ruin the crop in a few hours. It was found that the losses to rice growers from these birds in the fall of 1918 amounted to about \$150,000. In consequence of this an open season on bobolinks has been declared, which will have a tendency toward breaking up large flocks and reducing their num-

bers. In New Jersey, Pennsylvania, Delaware, Maryland, and the District of Columbia these birds may be shot from September 1 to October 30, inclusive, and in Virginia, North Carolina, South Carolina, Georgia, and Florida from August 16 to November 15, inclusive.

DAMAGE TO RICE BY WILD FOWL.

In the fall of 1917 many complaints were received of damage by wild ducks to the rice crop of the Sacramento Valley, Calif. Investigation was begun by an expert of the bureau as soon as the rice began to head the following August and continued until the harvest was well under way in October. Rice in this region is grown largely on low-lying and more or less alkaline lands unsuited for other forms of cultivation and therefore previously unutilized for agriculture. Considerable numbers of pintails and mallards breed in the marsh and slough areas, and late in summer many other birds congregate there, attracted by the water and food. On moonlight nights pintails come to the rice fields in large flocks to feed. Experiments were made with various means of driving out the birds. It was found that arming men with guns and stationing them in the fields was one of the best methods, supplemented by occasional aerial bombs that exploded among the birds and frightened them as they rose from the rice. As these ducks are protected under the migratory-bird treaty act, a special order was necessary granting permission to rice growers to kill them before the opening of the hunting season on October 16; after that date rice growers were permitted to shoot at night in fields still containing rice. These measures resulted in a saving of not less than \$125,000 worth of grain, while the number of ducks destroyed was nominal.

In November investigation was made of conditions in the rice district of Arkansas. Owing to unfavorable fall weather, probably two-thirds of the rice crop was unharvested as late as November 25. Migratory ducks, mainly mallards, were then arriving from the north and threatening serious damage. While the hunting season had opened, it was necessary to guard the fields at night, so that a special order had to be made under the migratory-bird treaty-act regulations, allowing rice growers to kill ducks at night.

MEADOWLARKS AND SPROUTING CORN.

The relation of the meadowlark to sprouting grain was a subject of field study in South Carolina. Reports received from most of the South Atlantic and Gulf States indicated that the food habits of the bird in the South were quite different from those it possesses in the North and that it was inflicting severe damage on sprouting corn. During March and April it was found that migrating flocks of these birds were spending a large part of their time in cornfields, feeding on the sweet germinating kernels, secured either by pulling up the sprouts or by making conical borings down to the grain. To afford farmers proper relief permission will have to be given them in certain areas to drive the birds from the fields with shotguns if necessary.

Similar complaints against mourning doves were not substantiated.

DESTRUCTIVENESS OF EAGLES.

From year to year definite and authentic reports are being received on the destruction of young fawns and wild turkeys, and even of young calves in some parts of the West, by golden eagles. Similar reports of the habits of both the golden and the bald eagle in relation to game come from Alaska. It is evident that these powerful birds are seriously destructive at times and their unlimited protection is probably not warranted.

IMMUNITY OF QUAIL AND GROUSE TO STRYCHNINE POISONING.

Important evidence has been secured regarding the comparative immunity of quail to strychnine poisoning. Field observations and feeding experiments conducted in California showed that one valley quail can eat grain containing enough strychnine to kill 12 ground squirrels without showing the slightest ill effect from the poison. A number of similar experiments on a mountain quail and a bob-white gave like results. The information thus gained will tend to allay fears in certain quarters that poisoning campaigns against ground squirrels result disastrously to these valuable game birds. Investigations in Saskatchewan, Canada, have proved that grouse are equally immune to strychnine poisoning.

FOOD HABITS OF OTHER BIRDS.

With a view to ascertaining the food habits of the vireos, examination of stomach contents has been continued and completed for all but one species; similar work has been started on the English sparrow, that its relation to constantly changing agricultural conditions may be known; and examination of the food of other species has progressed so far as a limited force permitted.

During the year two department bulletins were published, Attracting Birds to Public and Semipublic Reservations, and Food Habits of the Mallard Ducks of the United States, and several Farmers' Bulletins were revised. A report has been prepared on the food of winter-bird visitants, including the pine and evening grosbeaks, white-winged and red crossbills, hoary and common redpolls, pine siskin, snow bunting, the various longspurs, and the pipits. Another has also been prepared on the food of shoal-water ducks, dealing with the gadwall, baldpate, green-winged, blue-winged, and cinnamon teals, pintail, and wood duck. For educational purposes a lecture with lantern slides has been prepared on the value of birds to agriculture.

BIOLOGICAL INVESTIGATIONS.

The work of the Division of Biological Investigations has been seriously decreased, owing to the war. Two members of the scientific staff were commissioned in the Sanitary Corps and were in charge of rat-control work in France to safeguard Army supplies, and others were detailed to certain phases of urgently needed economic work.

As has been the case during past years, the field and laboratory work of the division has been conducted along broad lines helpful to the various other activities of the bureau. These activities include the enforcement of the migratory-bird treaty act; enforcement of the

Lacey Act regulating importations of, and interstate commerce in, birds and mammals; the administration of the mammal and bird reservations; general conservation of game birds and mammals; and work relating to the economic relations of mammals and birds to agriculture, forestry, and stock-raising.

The card indexes covering the distribution, abundance, and habits of all the species of North American mammals and birds have been greatly augmented during the year. These files contain data from many sources, including reports by field parties of the bureau, notes gleaned from correspondence and other outside sources, and records from publications.

DISTRIBUTION AND MIGRATION OF BIRDS.

Owing to war conditions fewer volunteer observers than usual reported on bird migration. However, 250 observers sent in reports from points throughout the United States and from many localities in Canada and Alaska. Considerable progress was made in compiling information from various publications on the distribution and migration of birds, adding materially to the files, which now contain more than 1,350,000 cards. This source of information is consulted daily in connection with the administration of the migratory-bird treaty act and the investigations of the economic habits of birds.

BIRD COUNTS.

Reports of the fifth annual series of counts of birds breeding on selected areas in various parts of the United States were received from 84 persons, who reported on over 100 different areas. Many of these counts, made on areas previously reported on, showed an increase in bird population. Owing to the unusual conditions throughout the country, on account of the war, many persons who had formerly taken part in the annual bird counts were unable to find time for this extra duty. With the gradual return of normal conditions, however, it is confidently expected that a large increase will occur in the number of these volunteer observers.

BIOLOGICAL SURVEYS OF THE STATES.

Good progress was made in the field work in Arizona, Florida, Montana, Washington, and Wisconsin, continuing the biological surveys which have been in progress during the past few years.

The "Mammals of Panama," one of the results of a cooperative biological survey of the Canal Zone in 1911-12, is about to be issued by the Smithsonian Institution. Works completed, but not published, include List of Mammals of New Mexico, The Mammals of North Dakota, The Mammals of Wyoming, The Birds of Texas, The Birds of Alabama, and The Birds of New Mexico. Negotiations are being conducted for the publication of the last three mentioned by the States to which the reports relate, and those on Alabama and New Mexico will probably be issued within a few months. A systematic study of the rice rats of North America was issued during the year.

BREEDING GROUNDS OF MIGRATORY WILD FOWL.

An investigation of the breeding areas of ducks in North Dakota, begun in June, 1918, was continued during July. * During June, 1919, the breeding grounds of ducks and other wild fowl in central Ne-

braska were investigated in order to compare the results with those found to obtain during former years. A gratifying increase of breeding waterfowl is evident in these States owing to the protection they have in spring under the migratory-bird treaty act.

WILD LIFE IN NATIONAL PARKS.

In cooperation with the National Park Service, Department of the Interior, investigations of the distribution, abundance, and habits of birds and mammals of Yellowstone and Glacier National Parks have been conducted during the past few years. During the fiscal year just closed revised reports on the birds and mammals of these two areas were published by the National Park Service in their educational literature; an elaborate report on Glacier National Park, comprising annotated lists of all the birds and mammals known to occur there, was completed during the year and was published by the National Park Service. A similar report on the mammals of the Yellowstone National Park has been prepared.

RELATION OF RODENTS TO FORAGE PRODUCTION.

In the spring of 1918 field investigations to secure information concerning the damage to crops and forage by injurious rodents were begun in several western States. By means of fenced and unfenced quadrats established on grazing areas where rodents abounded, studies of the damage inflicted by these pests were instituted. During the spring of 1919 a careful examination of these special areas was made and substantial progress in the elucidation of these problems has been effected. New quadrats were also installed. The results of this investigation will have great practical value in relation to forage on the western range lands.

MAMMAL AND BIRD RESERVATIONS.

The Federal big game and bird reservations in charge of this bureau, remain, as heretofore, 74 in number. Four are big game reservations; one, the Niobrara, created as a bird reservation, is used for both birds and big game; and 69 are bird reservations.

On June 30, 1918, the big game reservations contained a total of 368 bison, 274 elk, 54 antelope, and 21 deer, an increase in each species over the number reported last year.

The Government's seventh bison herd was established at Sullys Hill by the gift of the Park Commissioners of Portland, Oreg., of a nucleus herd of 6 animals. The Government's bison herds now aggregate about 950 head. Losses of antelope have been checked at the Wind Cave Reservation, S. Dak., and at the National Bison Range, Mont.

The number of visitors to the large game reservations is increasing, notably at Sullys Hill, Wind Cave, and at the National Bison Range. Trains on the new branch of the Northern Pacific Railroad from Dixon to Polson, Mont., now stop at Moiese close to the entrance to the main gate of the National Bison Range.

On the Gulf reservations arrangements were completed, as required by law (39 Stat., 1106), for assuming the full costs of warden service, formerly paid in part by the National Association of Audubon Societies. It became necessary also to purchase and maintain a patrol

motor boat at Big Lake Reservation, a service formerly provided by the Arkansas Fish and Game Commission.

Under the protection of the wardens, the useful birds on all the big game reservations have notably increased, but particularly on the National Bison Range and the Winter Elk Refuge, incidental to the protection of these reservations for mammals.

MAMMAL RESERVATIONS.

WINTER ELK REFUGE, JACKSON, WYO.—The main purpose of this reservation, which now has an inclosed area of 2,760 acres, is to increase the forage for elk by a limited amount of cultivation. The first cutting of hay is stacked and fed to the elk when there is no available pasturage, and the remainder is left to be grazed by these animals. Besides the hay raised, 2,103 bushels of oats were harvested from 56 acres, incidental to preparing ground for alfalfa. In the spring this area was disked and seeded, and in addition 140 acres having an inferior stand of alfalfa were dragged and reseeded to increase the yield of hay.

At the beginning of the year the hay on hand totaled 755 tons, 120 of which was cut in 1917 and 635 in 1918. Because of the light snowfall over the entire region, the maximum number of elk coming down at any one time to the refuge to be fed in the spring of 1919 was 3,000, as compared with a maximum of 10,000 for 1918. During 23 days of March (5th to 27th) 164 tons were fed to the elk, leaving a good supply on hand to supplement the harvest of this year. Some hay also was furnished by the State of Wyoming, and 25 tons of oat straw were fed to the elk.

No deaths from starvation were reported. A shortage of feed seems imminent for the coming winter, however, by reason of a severe drought. The drought has had the effect also of concentrating the ground squirrels around the irrigated areas, and as a result it has been possible to poison large numbers of them and thereby decrease their destruction of forage.

During the year somewhat more than 4 miles of new fencing was completed. The feeding corral built last year operated successfully and permitted segregating the young and weaker elk, thus protecting them from the main herd until they were fit to join it. Two cow moose visited the refuge on April 2.

The necessity for increased and definitely provided pasturage is immediate and imperative in order to deal justly with the settlers and to safeguard the existence of the elk. The precarious conditions surrounding the only two remaining large elk herds in the United States and a program for their conservation and for the action necessary to make them of the greatest value to the people are set forth in a department circular (No. 51), *Our National Elk Herds*, published in June in cooperation with the Forest Service.

NATIONAL BISON RANGE, MOIESE (NEAR DIXON), MONT.—The inclosed area of this reservation totals 18,521 acres. It is stocked with the following: Bison, 290 head (including 48 calves); elk, 125 (not including young; antelope 33 (not including young); and mule deer, 13 (not including young). Of the bison, one crippled bull died, and one young calf was killed by an accident.

Serious forest fires threatened the range in August and again in May. Seven hundred acres of young pines and spruces were de-

stroyed, but the fires were checked through the cooperation of the Indian and the Reclamation Services. Several incipient blazes were handled by the warden and assistants without serious loss.

Receiving basins 10 feet to 30 feet in diameter have been scooped out for conserving the water from the springs and making it accessible to the animals.

When the antelope "banded up" in the autumn the count disclosed but 32 as compared with 34 last year, probably the result of unlawful poaching in a remote part of the range. One doe was added by gift of the Oregon Game Commission.

WIND CAVE NATIONAL GAME PRESERVE, S. DAK.—In the 4,160 acres inclosed on this reservation, the big-game animals number as follows: Bison, 52 (including 12 calves); elk, 85 (not including calves); and antelope, 21 (including 7 young).

Thirteen coyotes (two of which were inside the inclosure) and seven bobcats have been killed this year. The scanty water supply has been increased by the development of the Ottman well.

SULLYS HILL GAME PRESERVE, N. DAK.—About 700 acres of this reservation are now inclosed and contain the following: Bison, newly established, 7 (including 1 calf); elk, 22 (not including calves); and deer, 6 (not including fawns).

NIORARA RESERVATION, VALENTINE, NEBR.—The big-game animals are at present held in two inclosures of about 200 acres each. The remainder of the reservation, about 4,500 acres north and about 9,000 acres south of the Niobrara River, is being inclosed in a stock-proof fence. The reservation is stocked with the following: Bison, 19 (not including calves); elk, 42 (not including calves); white-tailed deer, 2; Canada geese, 8. Pinnated and sharp-tailed grouse and other useful ground-nesting birds are increasing in numbers.

Two abandoned military structures are being salvaged for use in repairs of other buildings, and arrangements are being made for disposal under condemnation proceedings of the old "Administration Building."

A wire suspension footbridge has been built across the river, one dam constructed, and water from one spring conserved. By special efforts the prairie dogs were greatly reduced, possibly extirpated, thus saving considerable pasturage for the bison and elk.

BIRD RESERVATIONS.

On 10 of the 69 bird reservations, paid warden service has been maintained throughout the year, permanent warden service having been established at the Belle Fourche, S. Dak.; Big Lake, Ark.; and Strawberry Valley, Utah, reservations. At 8 other reservations part-time warden service is maintained during the nesting periods, the hunting season, or at times when serious trespass is likely to occur. Through the cooperation of the Reclamation Service, a general measure of protection is provided on most of the 19 bird reservations located within reclamation projects.

At the Minidoka Reservation, Idaho, a beginning has been made of making two islands of from 100 to 300 acres each, more attractive nesting and feeding places for useful birds, and important species of aquatic plants useful for food for waterfowl have been

introduced into Lake Walcott. Certain projected and necessary improvements could not be carried out on account of labor shortage.

At the Belle Fourche Reservation, S. Dak., permanent warden service has been provided, warden's quarters have been constructed, and a large area suitable for nesting and feeding places for wild ducks has been protected by fencing.

At the Big Lake Reservation, Ark., substantial progress has been made in locating, straightening, and defining the boundaries. Reports from various outside sources indicate that the reservation is now serving the purpose for which it was established.

At Deer Flat Reservation, Idaho, projected improvements were postponed on account of unsettled conditions.

At the Malheur and Klamath Reservations, Oreg., deplorable conditions exist on account of uncertainty concerning the status of certain lands embraced within these reservations. These conditions are under investigation, and it is confidently expected that both these reservations, which are of world-wide fame as natural breeding places for birds, and which should be unique and valuable assets not only for the immediate locality but also for the Nation, will be permanently preserved for the public benefit, and not be sacrificed for the temporary advantage of a few interested persons.

On the Hawaiian Islands Reservation a warden resident at Honolulu has been appointed to keep the bureau informed regarding conditions there.

The reservations in Florida are very inadequate to preserve what formerly was the most wonderful bird population of North America. The time when effective action is practicable is rapidly passing. With proper measures taken at once for establishing extensive refuges in southern Florida, one of the most wonderful assets of the State and of the Nation can be preserved from annihilation.

Reservations about the Mississippi delta were utilized during the year in securing material for a study of the effect of fish-eating birds upon commercial fisheries. A representative of the bureau visited the breeding colonies of Caspian terns and brown pelicans on the Breton and Tern Islands reservations in June; the latter reservation, near the Pass à l'Ouvre, is commonly known as the "Mud Lumps."

Increased protected areas suitable for breeding places for the migratory wild geese, ducks, cranes, swans, curlew, and shore birds should be provided. Additional wild-fowl refuges along the paths of migration are needed in order to secure improved and equalized opportunities for shooting wild fowl for food and for recreation, particularly in Iowa, Missouri, Kansas, and Illinois. All species of grouse and quail are also peculiarly subject to unnecessary and unwise depletion, which can best be minimized through reservations and provision of natural food supplies. The sage grouse requires special and immediate consideration.

There have been 28 convictions for violations of section 84 of the United States Criminal Code, prohibiting trespass on Federal bird reservations, with a number of cases still pending. Seven of these were for illegal shooting on the Malheur Lake Reservation, 19 on the Big Lake Reservation, and 2 on the Mosquito Inlet Reservation. It is hoped that these convictions will greatly strengthen respect for the law protecting the reservations.

THE MIGRATORY-BIRD TREATY AND LACEY ACTS.

The approval of the migratory-bird treaty act on July 3, 1918, to give effect to the treaty between the United States and Great Britain for the protection of migratory birds in the United States and Canada, concluded August 16, 1916, made possible the adequate protection of migratory birds in the United States. This act, which supersedes the migratory-bird law of 1913, contains many important provisions not found in the old law, especially those conferring on employees of the department appointed to enforce its provisions the powers of arrest, search, and seizure so necessary to its effective enforcement. Furthermore, the present act and the regulations thereunder contain many other new clauses covering the possession of migratory birds and the means by which they may be taken. It also provides for the collection and capture of birds for scientific and propagating purposes, as well as for the issuance of appropriate permits to kill any species of migratory bird found to be seriously injurious to agricultural or other interests.

The new law also supersedes the provisions of the Lacey Act with respect to the interstate shipment by common carrier of the dead bodies of wild birds and parts thereof, and adds new clauses prohibiting the shipment or carriage of living as well as dead birds—migratory and nonmigratory—out of a State by any means whatever contrary to the laws of the State in which the birds were killed or from which they were carried or shipped. The provisions of the Lacey Act relating to the delivery to a common carrier for transportation of foreign animals and birds, the interstate shipment of wild animals and parts thereof, and the penalty for knowingly receiving illegal shipments still remain.

The first regulations under the treaty act adopted by the Secretary of Agriculture became effective on approval by the President July 31, 1918. Amendments to these regulations were adopted and became effective October 25, 1918.

The designation "district inspector," applied to those appointed to enforce the migratory-bird law of 1913, was changed to "United States game warden," and the office of chief United States game warden for the administrative officer directly in charge of the administration of the treaty act was created when the act became effective.

For the first year this act was administered with a force of only 15 full-salaried game wardens, and 45 deputy wardens paid when actually employed. Much assistance and cooperation was rendered by most of the State game departments, and about 150 United States deputy game wardens were appointed from the deputy State game wardens, who received only a nominal salary from the Federal Government.

The wardens employed by the bureau reported for prosecution 531 violations of the law. Convictions have been secured in 116 cases, in which fines were assessed ranging from \$1 to \$100 and costs, and aggregating \$2,580. Of the remainder, 216 cases have been reported to the solicitor of the department for prosecution and are still pending; 5 cases have been dismissed by Federal judges; grand juries refused to return true bills in 15 cases, which probably will be resubmitted to grand juries or prosecuted by information; 79 cases are

still under investigation; and prosecutions were abandoned in 100 cases, due mainly to the fact that the violations were of a trivial character or the violators had already been convicted and adequately fined in State courts.

Convictions were secured in Federal courts as follows: Alabama, 28; Arkansas, 12; California, 4; Delaware, 1; Florida, 15; Georgia, 2; Idaho, 6; Illinois, 9; Iowa, 4; Louisiana, 1; Maine, 1; Maryland, 1; Minnesota, 2; Missouri, 4; New York, 3; Ohio, 3; South Carolina, 11; South Dakota, 1; Tennessee, 6; Texas, 1; and Virginia, 1.

Reports received to date show that 58 violators of both Federal and State laws were apprehended by United States deputy game wardens and were successfully prosecuted in State courts and fined an aggregate of \$1,918.75. The States in which these violations were prosecuted have thus benefited materially as a result of the cooperation of United States game wardens with State game authorities.

Wild ducks and other migratory birds of an approximate value of \$2,942.25 illegally killed or possessed, and aigrettes and plumes of other migratory birds of an estimated value of \$6,857.55 illegally possessed and trafficked in, have been seized. In most instances the birds seized which were fit for food have been released by the accused persons and donated to charitable or other public institutions and much of the plumage seized has been turned over by the courts or the accused persons to the bureau to be used for scientific and educational purposes. The remaining birds and plumes are being held as evidence to await disposition by the court.

During the year 621 scientific permits and 465 propagating permits were issued. The number of propagating permits issued does not approximate the number of persons who captured or possessed and trafficked in migratory waterfowl during the year for propagating purposes. The law is new and most persons possessing such waterfowl have not as yet become familiar with its provisions. The public is rapidly learning the requirements of the law, however, and is showing a gratifying desire to comply with them.

Marked progress has been made in breaking up the illegal traffic in aigrettes. Aigrettes in the United States are mainly the plumes of the American egret and snowy heron, which birds have been exterminated in many of the rookeries and greatly reduced in numbers everywhere by plume hunters, who wantonly kill the birds during the breeding season.

The treaty act and the regulations thereunder make it unlawful to possess, purchase, sell, or transport aigrettes or the skins or plumes of any migratory birds except under permit for purely scientific purposes, but the skins and feathers of migratory game birds lawfully killed may be possessed without a permit. The wearing of aigrettes and plumes of migratory birds other than the feathers of migratory game birds lawfully killed is thus made unlawful, and it is believed that women will refrain from wearing aigrettes or other prohibited plumage as soon as they have become familiar with the provisions of the law. The market for these plumes will then be closed and a check placed upon the indiscriminate slaughter of these beautiful birds for their plumage.

The extent to which this illegal traffic has been conducted was indicated when United States game wardens armed with a Federal warrant searched the apartment of a Seminole Indian at Miami, Fla.,

and seized aigrettes valued at about \$3,000. It is reliably stated that the yearly earnings of this Indian from the sale of plumes to Florida tourists and others have for several years exceeded \$5,000. The Indian is now under bonds to await the action of the Federal court.

The constitutionality of the migratory-bird treaty act has been upheld by Federal courts in Arkansas, Missouri, and Texas. These decisions have removed to a large extent the doubt existing in some quarters concerning the validity of the act, and have been a decided deterrent to those inclined to violate the law.

In Illinois, Ohio, South Carolina, and South Dakota legislation was enacted bringing the State game laws into practical uniformity with the provisions of the migratory-bird treaty act and the regulations thereunder, making a total of 28 States that have conformed their laws for the protection of migratory birds to the Federal law and regulations. The laws of three other States are nearly in harmony with the Federal regulations.

Many species of migratory birds have had a marked increase under the existing treaty act. Waterfowl formerly driven to the far north by spring shooting have remained in steadily increasing numbers to breed in localities where few or none had previously nested for many years.

State game commissioners, sportsmen, and others have extended cordial support and cooperation in the enforcement of the law, and the general opinion prevails that the treaty act properly enforced will restore our migratory game birds to such numbers as will continue to afford abundant legitimate sport. At the same time there will be an increase in the useful insectivorous and other migratory nongame birds.

INTERSTATE COMMERCE IN GAME.

The designation "district inspector, interstate commerce in game," was changed to "United States game warden" when the migratory-bird treaty act, approved July 3, 1918, became effective, and the enforcement of the provisions of the Lacey Act was delegated to all United States game wardens—15 in number—but 4 of these wardens, who had been previously assigned solely to Lacey Act work, were continued during the year in the enforcement of that law. The remainder of the wardens devoted their time mainly to the enforcement of the treaty act, but rendered incidental services in the enforcement of the Lacey Act.

The increased number of wardens performing Lacey Act work has resulted in greatly increased activity in the suppression of illegal interstate shipments of game. During the year special efforts were made to minimize shipments of beaver and deer skins and deer. In this the bureau secured the cooperation of many responsible concerns dealing in furs and game. The high prices paid for furs have encouraged some trappers to capture illegally and ship beaver skins to the market, but, as a result of the bureau's educational work in regard to the law, many firms dealing in furs have refused to purchase beaver skins or to receive shipments from States that have a continuous close season on beaver. Many of these firms have not only discontinued sending quotations to trappers in States which pro-

hibit the exportation of beaver skins, but have warned trappers not to consign to them beaver skins that have been illegally taken or shipped.

More than 1,000 interstate shipments of furs and game were investigated and 25 apparent violations of the Lacey Act were reported to the solicitor during the year. Of these violations, 12 were based on shipments which contained in the aggregate 27 carcasses of deer and 1,500 pounds of venison; 7 contained a total of 103 beaver skins; 2 contained 56 deerskins; 1 consisted of several shipments containing deer and elk hides; and 1 a shipment of aigrettes. Investigation of a large number of alleged illegal shipments is now in progress.

Violations of the Lacey Act reported for prosecution during the year to the solicitor originated in the following States: California, 1; Colorado, 1; Idaho, 1; Louisiana, 1; Maine, 5; Minnesota, 2; Montana, 2; New Hampshire, 4; Utah, 2; Vermont, 3; and Washington, 1. Twenty-three cases involving violations of the Lacey Act were disposed of in Federal courts. Seventeen prosecutions resulted in conviction of the accused and the payment of fines ranging from \$2 to \$1,000, the total amount of fines imposed being \$1,917. The other cases were not brought to trial.

Seventy-six cases, many of them involving the shipment of beaver skins, which for various reasons it seemed undesirable to prosecute in Federal courts, were referred by the bureau to State officials for prosecution in State tribunals. In 74 of these cases the accused were convicted and fines aggregating \$3,085 were imposed. One offender was sentenced to 90 days in jail and another was paroled.

IMPORTATION OF BIRDS AND MAMMALS.

War conditions during the first half of the year exerted a marked influence on the importation of birds from foreign countries. Although the armistice was signed on November 11, 1918, restrictions on shipments were not removed until some months later, and even at the close of the fiscal year normal conditions had not been restored, so far as the trade in birds was concerned. Ordinarily the number of permits issued for the port of New York exceeds that for any other port, but this year, even including the permits for birds from Central and South American countries, it amounted to less than 7 per cent of the total. Very few shipments were received from Europe although two or three lots of canaries arrived from Liverpool, London, and Rotterdam, the Rotterdam consignment being the first from Holland since the early days of the war. The parrot trade with tropical American countries, which forms an important item under normal conditions, has only recently begun to revive, as shown by the receipt of two considerable consignments from Nicaragua and Colombia.

The number of permits issued during the year decreased about 10 per cent, from 300 in 1918 to 273 in 1919, and the number of inspections from 76 to 42. Many of the permits issued were for the entry of foxes from Canada, the total number being 335, as compared with 391 in 1918. At Honolulu permits were issued for the entry of 195 birds, including pheasants, and several miscellaneous cage birds. So far as known, no prohibited species were entered during the year.

During the latter part of October and the early part of November, reports were received to the effect that a contagious disease was prevalent on some of the fox farms on Prince Edward Island, and the issue of permits for the entry of foxes was temporarily suspended pending an investigation. Through the cordial cooperation of the Canadian authorities, an examination of conditions promptly made disclosed the fact that the malady was local and noncontagious. The precaution had the effect of assuring importers that the Department realized the importance of protecting their interests and effectually guarding against the introduction of any contagious disease.

The increase in the number of shipments received at San Francisco was marked and included not only birds from the Orient and Australia, but also for the first time some direct from the island of Java. For the first time in 20 years, the number of canaries imported from the Orient nearly equaled the number received from European ports. As was the case last year, the receipts of miscellaneous non-game birds included a number of rare species, particularly from the Orient and from Venezuela. Among the most interesting entries were several shipments from Java, one of which included a number of jay thrushes, reported as *Garrulax pectoralis*. The consignment from Rotterdam, which arrived in April, contained in addition to canaries and other song birds, 12 species of waterfowl and shore birds, including a number of European green-winged teal, garganey or blue-winged teal, red-headed widgeon, and barnacle geese intended for exhibition in public zoological gardens or for propagation in private collections.

Among the rarer birds from Venezuela and Colombia were two Venezuela parrots (*Amazona barbadensis*), several bare-eyed robins (*Planesticus gymnophthalmus*), a puffbird (*Bucco bicinctus*), a cardinal (*Paroaria nigrogenis*), three black-necked screamers (*Chauna chavaria*), and several species of tanagers.

Reports of losses due to deaths among the birds en route were much more frequent than in any previous year. These were due in part to the long voyages from Australia and Java, but also to lack of care in handling the birds or packing them for shipment.

IMPORTATION OF QUAIL FROM MEXICO.

The regulations governing the importation of quail from Mexico remained in force without change during the past season, except that the time of entry was extended three weeks at the end of the season. The season was open in 1919 from February 15 to April 30. The ports of entry were the same as last year, Laredo and Eagle Pass, Tex., and New York City. Through cooperation of the Bureau of Animal Industry, the usual 10 days' quarantine was maintained at the two ports in Texas, and a thorough inspection of the birds was made during the period of detention. The first permit was issued January 8, 1919, and the number of quail for which permits were issued was 10,730, but the number released from quarantine was only 4,358, as compared with permits issued for 10,500 and the release of 5,205 in 1918.

Notwithstanding the fact that preparations were made long in advance of the season, both by importers and by several of the State game commissioners, to secure a large number of birds, the total number of quail secured was so small that only a fraction of the

orders could be filled. The long-continued drought in the Southwest, and particularly in the States of Coahuila and Tamaulipas, where most of these quail are captured, appears to have so reduced the number of quail that it was impossible to secure birds to meet the demand. Comparatively few birds held died during the quarantine period, and no case of quail disease was reported.

INFORMATION CONCERNING GAME LAWS.

The regular annual publications, including a directory of officials and organizations concerned with the protection of birds and game, the nineteenth annual summary of game laws, and a general poster showing open seasons for game in the United States and Canada, were issued and were widely distributed. The special poster showing open seasons in North Carolina, where a multitude of local laws apply to particular counties, has been discontinued. Copies of all changes in State laws relating to game were received, carded, and indexed for reference.

The Summary of the Game Laws of the United States and Canada for this year is the nineteenth annual publication of this bulletin. It is of widespread interest among sportsmen and conservationists and is of much practical service. An edition of 100,000 copies was required to meet the demand and supply the necessary distribution.

REPORT OF THE CHIEF OF THE BUREAU OF CROP ESTIMATES.

LEON M. ESTABROOK, *Chief of Bureau.*

WAR ORGANIZATION OF THE BUREAU.

The reorganization of the Bureau of Statistics and its change in title to Bureau of Crop Estimates in July, 1914, was coincident with the breaking out of the World War. It is fortunate that this reorganization was effected at that time, as the war, even before the United States took an active part in it, stimulated the demand for crop and live-stock estimates, estimates of surplus and deficiency of food and feed supply, consumption requirements, exports and imports of the United States and foreign countries, which the bureau could not have met with the old organization. The most important change involved in the reorganization of the bureau and the one which resulted in greatest improvement in the crop-reporting service was the appointment of trained field agents, one for each State or group of smaller States, who were in most cases legal residents of the States to which they were assigned, and whose interests were therefore closely identified with those of the people of the States in which their work is carried on, who travel over their States monthly during the crop season, personally observing and inspecting crops, interviewing the best informed men and enlisting their active cooperation in observing and reporting upon conditions for the monthly crop reports.

By the time the United States entered the war, in April, 1917, these field agents had become thoroughly familiar with local conditions and sources of information in their States, so that when the necessity arose

during the war emergency for obtaining dependable information quickly concerning present and prospective food supply, or any phase of crop and live-stock production for the use of the administrative officials of the Federal Government, it could readily be obtained within a few hours or days upon telegraphic request to the field agents. These requests, many of them urgent and without precedent, often involved an enormous amount of work on the part of the field agents, requiring them to work at all hours of the day and night, regardless of Sundays and holidays, but in every case they responded without complaint or hesitation, working conscientiously, efficiently, and loyally to do their part to help win the war. The same is true of the crop specialists, who are assigned to particular crops and collect information regarding their special crops wherever grown, without regard to State lines.

Not only did the war emergency develop the organization of the bureau to a high degree of efficiency of service, but it greatly stimulated the interest and zeal of the vast number of voluntary crop reporters, who serve without compensation. These men reported to the bureau on crop and live-stock conditions and in response to numerous special inquiries more conscientiously and with greater regularity during the war than before the emergency arose. In fact, one of the most inspiring features of our participation in this war was the universal readiness of every man, regardless of his situation in life, to contribute his time, thought, energy, and money, or make any other sacrifice required to help his country win the war against the common enemy.

On June 30, 1919, the bureau had 129 employees in the Washington office, and in the field 12 crop specialists, 39 field agents, and 50 clerks, or a total of 230 salaried employees.

The total number of voluntary crop reporters was 215,460, classified as follows:

Voluntary crop reporters.

List.	1919	List.	1919
Township.....	34,600	Potato.....	5,700
County.....	2,717	Sheep.....	6,446
County aids (estimated).....	5,434	Maple sirup.....	2,017
Field aids.....	25,042	Truck.....	10,000
Special price.....	7,664	Apple.....	9,500
Live stock.....	16,000	Peach.....	3,500

Cotton specialist.....	1,002		
Honeybee.....	5,964	Total ¹	215,460

¹ Exclusive of peanut, broom corn, bean, cranberry, and other special lists maintained by field agents.

For the fiscal year ended June 30, 1919, there was available \$346,232 from the annual appropriation and \$117,040 allotted from the war-emergency food-production appropriation, or a total of \$463,272.

WORK ACCOMPLISHED.

During the fiscal year ended June 30, 1919, the bureau issued the regular monthly crop reports, showing estimated acreages planted, growing conditions, yields per acre, and total production, farm prices of different crops for each State and the United States, estimates of total number of live stock of different classes on farms and ranges,

their condition, and losses from diseases and other causes. Commercial estimates of the apple and peach crops were made, and the weekly truck-crop news service was continued and extended. Many special inquiries were made during the year, including:

Quantity of commercial fertilizers used per acre of cotton and proportion of fields upon which used.

Percentage of various crops to which commercial fertilizer and manure was applied and quantity used per acre.

Binder twine requirements for the grain crops of 1918 for the use of the Grain Corporation.

Emergency live-stock survey, to determine the number on farms July 1, 1918.

Uses made of wheat crop, for the United States Food Administration.

Quantities of various crops fed to different classes of live stock.

Live-stock survey of January, 1919.

Fertilizer inquiry of January, 1919, to ascertain quantity of commercial fertilizers and manure used for various crops.

Wages of farm help.

Prices farmers pay for equipment, machinery, and supplies.

Percentage of farm labor requirements available.

Field agents prepared estimates of acreage, yield, production, and stocks on farms of wheat and corn by counties for the United States Grain Corporation, and they also prepared estimates of the value of agricultural production by counties in each of the principal States for the use of the Treasury Department. Field agents cooperated with officials of the Department of Agriculture, the Treasury Department, and the State extension services in the States where seed-grain loans were made to farmers in the drought-stricken regions of the Northwest and the Southwest in the fall of 1918 and spring of 1919.

The bureau compiled innumerable statements showing the production, consumption, surplus and deficiency, exports and imports, and prices of important agricultural products for all the principal countries before the war, and of production and requirements during the war, for the information of administrative officials of the Department of Agriculture, of other Federal departments, and various war-emergency organizations. Many of these statements were for the use of the department committee on crop production and were used as a basis for the crop-production programs which were recommended. Other compilations were made for the confidential use of the War Trade Board and for the Committees on Agriculture in Congress.

Summaries of weekly reports of the State field agents of the bureau were furnished for the confidential information of the Secretary and chiefs of bureaus of the Department of Agriculture, and after the signing of the armistice the mailing list for these summaries was extended to include other Government officials and Senators and Members of the House of Representatives. Bimonthly foreign crop reports were issued in the spring of 1919 and will be continued.

A vast amount of information was compiled and furnished in response to inquiries received by telephone, telegraph, letter, or personal call of representatives of the Food Administration, the War Trade Board, the War Industries Board, the Military Intelligence Office of the War Department, the Tariff Commission, the Federal Trade Commission, the Council of National Defense, other departments of the Federal and State Governments, Congress, and private individuals. The statistical library of the bureau was in constant use by such representatives. The limited clerical force of the bureau was taxed to the utmost in compiling and tabulating statements and furnishing information urgently needed for immediate use.

More than 4,000,000 pieces of mail were handled by the Division of Crop Reports during the year, as compared with 3,200,000 by the same division for the preceding fiscal year, an increase of 25 per cent. About the same relative increase was noted in all other branches of the bureau at Washington.

In the State offices of field agents the work more than doubled in the fiscal year 1919 as compared with the preceding year. The issuance by field agents of monthly State crop reports bearing their names which are generally reproduced in all the State papers has made them widely known throughout their States and has resulted in a heavy volume of correspondence. Many of the field agents are becoming more and more recognized among business men and

FIG. 1.—The shading indicates States cooperating under formal agreements with the Federal Bureau of Crop Estimates in the collection and dissemination of monthly estimates relating to crops and live stock.

Cooperative agreements are under consideration in several States not shaded in the above map, and partial cooperation exists in some others as a result of mutual interest.

officials of the State governments and State institutions as the best authorities on the statistics of agriculture in their States, so that the practice is growing of referring correspondence calling for statistical information to the field agent of the Bureau of Crop Estimates. A considerable number of requests for information regarding localized production within a State, such as special crops or county estimates, are regularly referred by the Washington office of the bureau to the State offices of field agents. The steadily increasing demand for detailed information which can be furnished only by the State field agents indicates the need for providing them with adequate office space, equipment, and clerical assistance.

COOPERATION WITH STATE DEPARTMENTS OF AGRICULTURE.

During the fiscal year just closed cooperative agreements were entered into between the Bureau of Crop Estimates and the State

departments of agriculture of Arkansas, Georgia, Alabama, North Carolina, West Virginia, Illinois, Iowa, Oklahoma, and Idaho. These agreements provided for pooling the crop reporting resources of the two organizations and the issuance of a single cooperative monthly State crop report in order to avoid unnecessary duplication of work and expense and to improve the service. This plan of combining the force and funds of the bureau with those of State departments of agriculture has proved highly satisfactory in all States in which it has been tried. The shaded portions of figure 1 show the States with which the bureau is now cooperating.

FIG. 2.—The shaded portion indicates States requiring assessors to gather agricultural statistics from farmers annually, including generally acreages planted to specific crops, numbers of bearing fruit trees, numbers of live stock, and other statistical information relating to agriculture. This information has no bearing on taxes, but is of the utmost value to the State and Federal agricultural authorities, not only as a basis for accurate monthly crop estimates for the information of producers and business men, but in agricultural and marketing plans of which such information must necessarily form the base. In addition to the States shaded, which have laws for the collection of statistics by assessors, North Carolina assessors are proceeding to gather the information in advance of the enactment of such a law. Florida has legislation providing for biennial censuses. In practically all States the tax assessors make an annual census of live stock.

STATE ASSESSORS' RETURNS.

In a number of States the efficiency and value of assessors in collecting agricultural data of fundamental importance in crop and live-stock estimating, such as acreages planted to different crops and the number of live stock of different classes on all farms within the State, has been fully demonstrated, notably in Wisconsin, Ohio, Nebraska, Iowa, Kansas, and Missouri. The bureau is, therefore, systematically encouraging the use of assessors' returns as a basis of estimating and is cooperating with State officials to see that proper steps are taken to insure that the returns shall be complete and that they shall be properly edited and tabulated so that dependable

results will be available before the final estimates of acreage and production are issued for publication. When so checked for completeness and correctness, assessors' returns of agricultural data, which have no connection whatever with taxation, form an annual census of the greatest value. During the winter and spring months of 1918-19 a number of State legislatures amended old laws or passed new laws providing for the collection of agricultural data by assessors. The States which now have such laws are shown in the shaded portions of figure 2. It is hoped that all States will join in this movement to ascertain accurately the agricultural resources of each county and State annually.

ACCURACY OF THE CROP ESTIMATES.

The value of the crop and live-stock estimates depends upon their accuracy and timeliness, and the amount of detail. The degree of accuracy of the estimates can be determined only approximately for most crops, by checking against such figures as are available for crop movement, receipts at primary markets, and exports. In the case of the cotton crop, however, an absolute check is afforded by the annual census of the number of bales ginned. The following table shows the annual estimates by this bureau in December in comparison with the annual report of bales ginned by the Bureau of the Census the following March:

Annual cotton estimates of the Bureau of Crop Estimates, compared with annual Census reports of cotton ginned.

Crop year.	Pounds of cotton (000 omitted).		Over estimated.	Under estimated.
	Estimated by Department of Agriculture.	Finally reported by Census Bureau.		
1900-1.	4,856,738	4,846,471	<i>Per cent.</i> 0.2	<i>Per cent.</i>
1901-2.	4,529,954	4,550,950		0.5
1902-3.	5,111,870	5,091,641	.4	
1903-4.	4,889,796	4,716,591	3.7	
1904-5.	6,157,064	6,426,698		4.2
1905-6.	4,860,217	5,060,200		4.0
1906-7.	6,001,726	6,354,110		5.5
1907-8.	5,581,968	5,312,950	5.1	
1908-9.	6,182,970	6,336,070		2.4
1909-10.	4,826,344	4,783,220	.9	
1910-11.	5,464,597	5,551,790		1.6
1911-12.	7,121,713	7,506,430		5.1
1912-13.	6,612,335	6,556,500	.9	
1913-14.	6,542,850	6,772,350		3.4
1914-15.	7,637,113	7,718,980		1.1
1915-16.	5,338,588	5,354,406		.3
1916-17.	5,506,896	5,480,012	.4	
1917-18.	5,237,379	5,406,350		3.0
1918-19.	5,595,529	5,760,184		3.0
19 years, 1900-1919.	108,055,647	109,585,903		1.4
5 years, 1914-1919.	29,315,505	29,719,932		1.4
3 years, 1916-1919.	16,339,804	16,646,548		1.8

It will be noted that the bureau estimated the cotton crop of 1915 within three-tenths of 1 per cent, the crop of 1916 within five-tenths of 1 per cent, the crop of 1917 within 3.1 per cent, and the crop of

1918 within 2.7 per cent of the final ginning figures. The wider deviation in the estimate of the 1917 crop was due to the price of cotton in the winter of 1917-18, which made it profitable to pick closer than had ever been done before, the picking continuing as late as February and March in some States. The underestimate of 1918 was due to the comparatively mild winter, which made it possible for more bolls to mature than could be foreseen by the growers, and prevailing prices made it profitable to pick all that opened. The practice of harvesting "bolly" cotton—i. e., unopened bolls—has gradually extended throughout the cotton belt because of the demand for cotton and relatively high prices.

In 1918 for the first time the bureau had a fairly complete check on its estimates of wheat production, afforded by the records kept by the United States Grain Corporation. At the close of the fiscal year the Grain Corporation had reported approximately 730,000,000 bushels of wheat received from farms. The 1918 crop as estimated by the bureau was 917,000,000 bushels, with 8,000,000 on hand July 1, 1918, from the previous crop, making a total of 925,000,000 bushels available. Of this amount approximately 105,000,000 bushels were used for seed, 25,000,000 bushels of damaged or inferior grain is normally fed to poultry and other live stock, and after deducting the 730,000,000 reported by the Grain Corporation as marketed from farms, there is left 65,000,000 bushels to be accounted for. It should be remembered that the Grain Corporation gets no reports of wheat ground in mills of small capacity, which includes many small country grist mills in every State in which wheat is grown and consumed locally, the annual capacity of which is far in excess of 65,000,000 bushels. Apparently the bureau underestimated the 1918 wheat crop slightly, perhaps as much as 2 per cent. In all probability the estimates of the United States wheat crop were about as accurate as an agricultural census by ordinary methods.

DEMANDS FOR IMPROVED CROP AND LIVE STOCK REPORTING SERVICE.

The war emergency not only demonstrated the efficiency and the value of the crop-reporting service but also showed the need for improvement to meet continuing demands upon the service, which can only be partially met with the present force and funds. These demands may be classified as follows:

(1) The demand for estimates and forecasts of the consumption, market, export, and import requirements and available surplus of agricultural products, not only in this country but in foreign countries as well. This information is needed as a basis for intelligent planting and marketing programs, the importance of which was fully demonstrated during the war and will continue to be of equal importance in the years to come, as population increases without a corresponding increase in arable land in this country, and as competition develops with foreign countries.

(2) The demand for information in advance of planting time or while planting is in progress as to acreage to be planted to crops, in order that any prospective surplus or deficiency may be equalized by modifying later plantings in accordance with prospective supply and demand. Estimates of farmers' intention to plant were made in

the spring of 1917 and 1918 for the information of the administrative officers of the Government, and came very close to final estimates.

(3) The demand for crop and live-stock estimates by counties. This demand developed prior to the war, and during the war it became more and more insistent. The bureau has realized the desirability of making its estimates by counties as well as by States to meet the growing demand for such information, but has been unable to shift from a State to a county basis (a) because of the time that has elapsed since the last census by counties, during which intervening period great changes have occurred in many States; (b) because of the enormous increase in detailed work involved in changing from estimated totals for 48 States to estimates for nearly 3,000 counties; and (c) because of inadequate funds and force, which would not permit of further expansion of the service. However, during the war period, with such emergency funds as were available, it was found practicable to change more or less completely from a State to a county basis in six States and to make a beginning in a considerable proportion of the others, the change being made in the offices of the field agents for those States. The details of the county estimates are published in the State reports issued by field agents and not in the Monthly Crop Reporter published at Washington. During the present fiscal year all field agents will attempt to collect and tabulate data by counties, so that following the 1920 census the entire system of crop reporting will be on a county basis, if sufficient funds are provided by Congress to enable the bureau to consummate this plan. County estimates localize crop and live-stock data so as to be of more practical use than mere State totals, and such localization tends to increase the accuracy of the reports. They show the agricultural resources and production of each county, as well as surplus and deficiency of supply; equalize distribution; facilitate marketing; enable transportation companies to supply cars needed for moving surplus crops, and manufacturers and merchants to provide farm machinery and supplies when and where needed; and form the basis of much of the constructive work of the agricultural colleges and county agents.

(4) The demand for "commercial" crop and live-stock estimates. i. e., estimates of marketable farm surpluses, which is the portion of the crop that is sold from the farm, enters the channels of trade, becomes a part of the visible supply, and influences prices, has also developed to a point where provision should be made for supplying it. For half a century the bureau has been estimating total crop and live-stock production, which includes not only the portions of the crops which are marketed, but the portions which are fed, consumed, damaged, lost, wasted, or utilized in various ways on the farm. It is necessary that total production should continue to be estimated, because it is the basis of commercial production, the proportion of the total which is marketed varying with market demands and prices. On the other hand, it is the commercial production or marketable surplus which makes up the commercial or visible supply and in which producers, consumers, and distributors are alike interested. Dependable information concerning commercial production of farm commodities is essential to any enlarged program of market-

ing. To meet partially the demand for estimates of commercial production, the bureau has at various times estimated the percentage of total production of certain crops in each State that is marketed for each month of the year. In the case of apples, peaches, and truck crops, these estimates have been published in terms of bushels, barrels, crates, or car lots. In the spring of 1919 a program was prepared for estimating the commercial production of the late crop of white potatoes. Commercial estimates involve a rather intensive survey of the principal areas of commercial production, the organization of a special corps of crop reporters, and the employment of crop specialists who are familiar with the industry and can devote their entire time to collecting, summarizing, and interpreting data regarding the particular crops in such form as to be of practical use to growers and to the marketing agencies.

(5) Reserve stocks on farms. A further development of the increased interest in the food supply during the war period has been the demand for information concerning reserve stocks on farms. This is closely related to the demand for information regarding commercial production or marketable surpluses on farms, but it takes the form of requests for information as to the portion of the total marketable surpluses that remains unsold on farms at frequent intervals. This information is essential in connection with estimates of visible supply, that is, stocks of farm products in public and private warehouses, mills and elevators, in transit, and in factories and wholesale establishments. If the bureau were provided with adequate funds, it would be entirely practicable to furnish such estimates monthly. In the past it has been practicable to make such estimates for only a few crops annually. The program for commercial potato estimates provides for estimating stocks of potatoes on farms monthly throughout the year. A similar program should be developed for other crops.

(6) New crops. Much interest was also manifested during the war and since the war in estimates of new crops, or rather crops concerning which dependable data were lacking, such as castor beans, or phases of production, demand for and supply of farm and forest products, such as rosin, turpentine, cotton linters, sorghum sirup, soy beans and velvet beans, and the vegetable oils.

(7) Live stock. No phase of crop estimating has been less satisfactory than the live-stock reporting service by reason of its inadequacy. Because of lack of funds and facilities, these reports have been limited to estimates of the number of animals on farms once a year, the percentage of losses from disease and exposure annually, the condition of live stock on a percentage basis, and the number of brood sows, without any estimates whatever of milk, butter, cheese, poultry and egg production. The live-stock industry is worth approximately \$10,000,000,000, and yet the bureau has had less than \$50,000 available for reporting upon all classes of live stock. The expenditure of \$500,000 annually would be fully justified in furnishing satisfactory monthly reports covering number, condition, age, sex, and breed of different classes of live stock, and of dairy and poultry production, slaughter, losses from disease, insects, exposure, and other causes, farm prices, present and prospective supply of feed, and similar data. Such estimates can be furnished for half the

amount named and would be of untold value to the industry, because definite, detailed, and timely data would be available which would enable growers to decide intelligently upon long-time programs of production, how and when to sell, and how best to take advantage of the feed situation. Such data are also essential to any program of crop production which involves live stock as a part of the farm-management program, and are absolutely necessary as a guide to intelligent marketing and distribution of live stock and live-stock products. With the limited funds at its disposal the bureau has endeavored to meet the increasing demand upon it for live-stock information, with an ever-increasing realization of the inadequacy of the present live-stock reporting service and of the funds and force available for improving the service.

(8) Special phases of agriculture. The war also stimulated interest in special phases of agriculture, and many requests continue to be received for information on farm wages; hours of farm labor; prices farmers receive for their products; prices farmers pay for equipment, machinery, and supplies; progress of farm work; amount of binder twine required; seed requirements, supply, surplus, and deficiency; number of farm tractors; number of silos; storage capacity on farms; average distances farmers must haul products to nearest market or shipping station; kinds and quantities of fertilizers required for different crops and sections of the country; farm income and outgo; extent to which particular varieties of crops are grown and compete with each other; methods of planting, cultivating, and harvesting crops, which are different in different States; utilization of different crops; and similar information bearing on crop and live-stock production as an industry. Requests of this nature are received largely from special investigators employed in other branches of the Department of Agriculture or in the State agricultural colleges and experiment stations, from legislators, representatives of farmers' organizations, and of the press. The bureau was able to furnish much of this information during the war from results of former special inquiries or to secure it from new investigations. With the reduced appropriation available in the present fiscal year it will be impracticable to make additional investigations of this kind.

(9) Foreign crops and live stock. Interest in the foreign crop and live-stock situation during the war was unprecedented in this country. The demand for information concerning consumption, production, import and export of food crops in Europe, and the available supply in countries of surplus production was constant and is continuing. The bureau files of reports from the International Institute of Agriculture and the published and unpublished statistical reports of foreign Governments were consulted almost daily by representatives of other Government departments and war-emergency organizations. Detailed studies were made by specialists of this bureau for the use of economists who accompanied the peace commission to Paris. Estimates of food requirements of foreign countries, their reserve stocks, production and net imports, were essential factors considered by the department's committee which had charge of formulating programs of production in this country during the war. Continued interest in world production and consumption indicates the need for more systematic periodic reports as a guide to production and marketing in this country.

The foregoing indicates some of the principal classes of calls upon the Bureau of Crop Estimates for information in 1917 and 1918. Fortunately the bureau had a highly specialized skeleton organization and through long experience had developed an efficient system for estimating quickly the production and supply of most agricultural commodities in this country and abroad. The additional funds provided out of the war-emergency appropriation for stimulating food production enabled the bureau for the first time to supply the offices of its State field agents with some of the most necessary equipment and with field clerks, without which it would have been impracticable to do more than continue the regular crop estimates on a prewar basis. The war emergency demonstrated the efficiency and value of the crop-reporting service, not only in time of war but still more in time of peace, as an organization for ascertaining and summarizing the essential facts of crop and live-stock production which are necessary for the guidance of farmers, and for the formation of intelligent plans of production and marketing. This service is of such great practical and economic value to agriculture as an industry which is and always will be of fundamental importance in the United States, that the service should be greatly expanded, developed, and specialized in the future.

REPORT OF THE DIRECTOR OF THE STATES RELATIONS SERVICE.

A. C. TRUE, *Director.*

INTRODUCTION.

The States Relations Service represents the Secretary of Agriculture in his relations with the State agricultural colleges and experiment stations under the acts of Congress granting funds to these institutions for agricultural experiment stations and cooperative extension work in agriculture and home economics, and in carrying out the provisions of the acts of Congress making appropriations to the Department of Agriculture for farmers' cooperative demonstration work, investigations relating to agricultural schools, farmers' institutes, and home economics, and the maintenance of agricultural experiment stations in Alaska, Hawaii, Porto Rico, Guam, and the Virgin Islands.

The organization of the service includes the following offices: (1) The Office of the Director, which deals with the general business and administration of the service and the work relating to agricultural instruction and farmers' institutes; (2) the Office of Experiment Stations; (3) the Office of Extension Work in the South, including the farmers' cooperative demonstration work and the cooperative extension work in 15 Southern States; (4) the Office of Extension Work in the North and West, including the farmers' cooperative demonstration work and the cooperative extension work in 33 Northern and Western States; and (5) the Office of Home Economics, including in-

vestigations relative to foods, clothing, and household equipment and management.

During the past year the service continued to have charge of the work authorized by Congress in the item in the food-production act of August 10, 1917, providing "for increasing food production and eliminating waste and promoting conservation of food by educational and demonstrational methods through county, district, and urban agents and others." A war emergency fund of \$6,100,000 for this purpose was used through the two extension offices for the expansion of the work of the county agricultural agents, home demonstration agents, and boys' and girls' clubs.

The service directly administered regular and emergency appropriations aggregating \$7,304,940, and had administrative and advisory relations in the expenditure of \$4,020,000 of Federal funds (\$1,440,000 for agricultural experiment stations and \$2,580,000 for cooperative extension work) and \$2,100,000 of State funds used as an offset for Federal funds under the cooperative extension act. In addition, the agricultural colleges and experiment stations used in experimental and extension enterprises over \$8,750,000 derived from sources within the States.

In the fiscal year 1918-19 the force carried on the rolls of the States Relations Service aggregated about 7,000 employees. The total number of persons employed in cooperative extension work in agriculture and home economics was about 7,500. Over 2,400 counties had agricultural agents and about 1,700 counties and 200 cities also had home demonstration agents. About 2,000,000 boys and girls were connected with the agricultural and home economics clubs. In the fiscal year 1917-18 the State agricultural experiment stations employed 1,684 persons, of whom 449 did some extension work.

Up to the signing of the armistice the service was busily engaged in aiding the State and county extension forces and through them the farmers throughout the country in increasing agricultural production to meet the war needs, and both country and city people in conserving the products and making most economical and effective use of available supplies. During the remainder of the year special attention was given to the problems of agriculture and household economy growing out of the discontinuance of military operations and the beginning of adjustment to meet conditions arising in the settlement of world affairs after the war. An effort was also made by the extension forces to perfect and establish on a permanent basis the cooperating agencies among the farming people, in order that the extension work might rest more securely on the initiative and active participation of the people themselves.

Uncertainty regarding the policy which would finally be adopted in making grants of Federal funds in lieu of the war-emergency appropriations made it impracticable to determine definitely the amounts of State and local funds which would be required to maintain the existing organization and work in the several States and localities. For this and other reasons the fiscal year closed without settlement of important problems regarding the continuance of various agencies and methods for extension work on the scale on which they had been organized in war time. It is now evident, however, that the system of extension work extended so rapidly under war conditions has commended itself to the people in very large

measure as a thing which will be useful to them in times of peace. They are therefore making strong efforts to maintain it by local contributions, as far as these are needed to supplement Federal and State funds. The number of counties in which it has been necessary to withdraw the agricultural agents is much smaller than was anticipated. Several hundred home demonstration agents have been discontinued. But there is a general feeling that in a comparatively short time the extension forces will be as numerous as ever and that the system will continue to grow until it covers the entire country.

The close of the war has brought the agricultural experiment stations in the States back more completely to their fundamental work of agricultural research. The changes in their activities and personnel during the war have necessitated considerable reorganization of their forces and projects. In this readjustment work the Office of Experiment Stations is giving them as much assistance as possible. The experiment stations maintained by the service in Alaska and the insular territories are continuing both research and extension work, taking advantage of the increased interest in the agricultural development, due to the imperative demand which the war brought about, to make those regions more self-supporting.

The Office of Home Economics, through participation in the food survey conducted by the Bureau of Markets and in the work of various war-time agencies dealing with problems of the conservation and utilization of agricultural products, has gained and disseminated much valuable information which will serve as a basis for research needed in connection with teaching and extension work in home economics.

The movement of events growing out of the war has greatly stimulated the interest of our people in vocational education. One result of this has been that the department has been called upon in increased measure to furnish the up-to-date information and illustrative material in agriculture and home economics which the schools need to make their work in these lines most effective. The States Relations Service has done what it could to aid the schools in developing satisfactory courses of instruction in these important branches.

OFFICE OF THE DIRECTOR.

EDITORIAL DIVISION.

W. H. BEAL, *Chief*.

The work of this division included the business connected with (1) the editing of all publications of the service except Experiment Station Record, and (2) the collection, preparation, and distribution of illustrative material.

There was a decrease in the number of different publications issued during the year, but many of them, especially those bearing on food production and conservation, were printed in large editions to meet emergency demands, so that the number of copies was greater than in previous years. The publications issued included 64 documents aggregating 3,997 pages, as follows: Nineteen numbers of Experiment Station Record, 2 reports, 6 technical bulletins (2 relating to work in agricultural education and 4 to investigations in home economics), 1 article in the Journal of Agricultural Research, 10 publications of the insular stations, 2 popular lectures (with lantern

slides), 20 documents relating to cooperative extension work in agriculture and home economics, and 1 general administrative circular. In addition to these more formal printed documents the service issued either in printed or in mimeographed form a number of other documents, including leaflets of various kinds, report forms, record books, and the like, required in connection with special features of the work of the service, and cooperated with the Office of Information in the preparation of press and other informational material of wider general interest relating especially to the promotion of increased production, conservation, and economical use of food and the organization and development of the cooperative extension work.

ILLUSTRATIONS SECTION.—This section was in charge of Reuben Brigham. There was a marked increase in the work of the section connected with the collection and preparation of illustrative material for service use. An increased number of photographs taken either by our own force or in cooperation with the Division of Publications was added to the collection, which now contains about 10,495 photographs, 7,826 of which are mounted, classified, and catalogued for ready use. Over 1,500 new photographs were added to the collection during the year.

The total number of lantern slides made was 15,253, of which 3,153 were colored. The section organized several new series of lantern slides for special purposes, particularly for the use of extension specialists, county agents, or other workers cooperating or collaborating with the service. It is developing in this way a flexible collection of slides that may be adjusted to meet a large variety of local needs and conditions. The division continues to make a special feature of lantern-slide color work with the result that it now has a considerable collection of colored slides of unusually high quality. In addition to the coloring of lantern slides some attention is being given to the coloring of bromide enlargements.

The methods of handling the illustrative material, particularly lantern slides, were also improved. There were lent during the year, mainly to extension workers and schools teaching agriculture, 1,346 sets aggregating 67,300 slides. The demand for this service has increased rapidly.

Work in the preparation of charts and drawings for service use progressed rapidly during the year as a result of the employment of a competent artist to give full time to such work.

The section cooperated with other offices of the service and with the Office of Exhibits of the department in planning and preparing a representative exhibit of the work of the service for use in connection with the general department exhibit for State fair circuits. The section also cooperated with other offices of the service and with the assistant in charge of motion-picture activities in outlining and staging two films illustrating cooperative extension work, one in Florida, illustrating home-demonstration work in the South, and the other in Maryland, illustrating cooperative extension work and organization in relation to improving methods of apple production.

Several mimeographed circulars explaining how to make good photographs, lantern slides, and charts for extension and school use were issued.

INVESTIGATIONS ON AGRICULTURAL INSTRUCTION IN SCHOOLS.

ALVIN DILLIE, ¹⁸*In charge.*

Particular attention was given during the year to the preparation of subject matter in form for use in teaching vocational agriculture in secondary schools, and to plans for training teachers for these schools. At the same time the elementary rural school studies were not neglected.

Previous to the signing of the armistice there was cooperation with other divisions and bureaus in promoting instruction relating to problems of food production and conservation. Studies were made of the training of unskilled farm labor and of city boys to do farm work. Studies of the educational work of the colleges with the Students' Army Training Corps, especially the instruction in agriculture being given to these men, were also begun. Sets of lantern slides, charts, and reference material were supplied to instructors in agriculture at various army camps. The signing of the armistice brought a sudden end to this special war work, and after that time attention was turned to problems of readjustment in agricultural teaching.

The preparation of material in the form of bulletins, circulars, leaflets, etc., for the use of teachers of agriculture continued to receive a large amount of attention. Lessons in dairying and on potatoes for rural elementary schools were published in bulletins which were widely distributed. Twelve leaflets on how teachers may use certain Farmers' Bulletins were also printed and distributed. Owing to an increased demand for material for use in schools teaching agriculture a number of earlier bulletins were reprinted.

The preparation of a two years' course of study for negro vocational schools was undertaken in cooperation with the Federal Board for Vocational Education. The first year's course, lessons in crop production, was completed and turned over to the Federal Board, and the preparation of the second-year course, lessons in animal production, was well advanced. A conference was conducted at Hampton Institute with negro teacher trainers and supervisors of agriculture, at which the first course was carefully reviewed and explained.

While the war checked in some measure the development of instruction in agriculture, the interest in agriculture was greatly increased by the emphasis placed on food production and conservation. With the close of the war State authorities began to turn their attention to the development of the agricultural schools, more especially those teaching vocational agriculture. This was shown by the increased demand for material that would help in the solutions of their teaching problems.

The demand for help in visual instruction was in excess of the supply of material available. During the year there were prepared the following lantern-slide sets with mimeographed syllabi: Lessons in planning and planting a garden; lessons on dairying; a six weeks' course in farming for women; war camp farms in the United States in 1918; a revision of the home projects in agriculture. There were also available for use in this work sets of slides, with lecture notes, on the farm water supply; flies and their relation to health; the mosquito and its relation to health.

The lantern-slide service has had a wide range, including schools in 32 States and a few schools in Canada. Slides were also loaned

to the Y. M. C. A. camp service for use both in the United States and in France. In Texas and Massachusetts a set of each of the slides was placed in charge of the State departments of agricultural education to be sent out on circuits to the schools teaching agriculture. This service proved very effective and it is hoped will be extended during the coming year. Plans were developed to widen the scope and type of illustrative material, especially to assist the States to obtain duplicates of the material available.

The division continues, as heretofore, to review and abstract for Experiment Station Record the literature on agricultural education, this work requiring a large portion of the time of one member of the staff.

During the year various field trips were made by members of the staff, including visits to State and regional conferences of agricultural directors, supervisors, and teachers; associations at which agricultural instruction was discussed; State colleges giving attention to the training of teachers of agriculture; and schools giving instruction in agriculture. During these trips conferences were held and all assistance possible given to the men in the field.

Relations of the most cordial nature were maintained with the various bureaus of the department and helpful assistance was rendered by these bureaus.

INVESTIGATIONS ON FARMERS' INSTITUTES.

J. M. STEDMAN, *Farmers' Institute Specialist.*

Farmers' institute work in the United States during 1918 as compiled from reports from 31 States included 6,941 institutes, which lasted 7,184 days, comprised 14,446 sessions with an attendance of 1,916,706, employed 2,002 lecturers, and cost \$260,826.09, divided between State appropriations of \$184,463.24 and other funds contributed to the amount of \$76,362.85.

The States Relations Service continued to aid farmers' institute workers, as well as county agents and other extension teachers throughout the country, along the same lines as heretofore. Three new lectures. Renovating the neglected apple orchard, Growing and handling Irish potatoes, and The city and suburban vegetable garden, were published, each accompanied with 50 lantern slides. These lectures were used not only by farmers' institute lecturers but more especially by county agricultural agents, from whom the demand is constantly increasing. They are also used by home-demonstration agents, club leaders, teachers of agriculture in high schools, and extension teachers in agricultural colleges, by grange lecturers, and by other persons who desire aid in presenting their subject before audiences of farmers.

During the year lectures, each accompanied with a set of 50 lantern slides, were loaned to 604 extension workers.

OFFICE OF EXPERIMENT STATIONS.

E. W. ALLEN, *Chief.*

The Office of Experiment Stations continued to exercise its three-fold function of administration, advice, and publication, with

reference to the experiment stations in the States sharing in the Federal appropriations for experimentation and research in agriculture. In discharging this function it not only exercised supervision of the work and expenditures of the stations in order that the intent of the Federal laws might be realized, but it aimed to stimulate and assist the activity intended to be promoted by these laws. This was done as heretofore by maintaining close contact with the stations through annual visits to the stations, correspondence, and the editorial pages of *Experiment Station Record*.

The publication activity of the office was represented by an annual report to Congress on the work and expenditures of the State and insular stations, the issue of *Experiment Station Record*, and the preparation of the card index of American experiment-station literature, which has been in progress for nearly 30 years.

RELATIONS WITH THE STATE AGRICULTURAL EXPERIMENT STATIONS.

The needs arising under war conditions brought the work of the State experiment stations and of this department and other Federal and State agencies into closer and more intimate relationship, giving rise to numerous cooperative endeavors. The stations were called upon for unusual forms of service, which often required interpretation of the Federal acts in relation to such use of the funds. Under the circumstances as liberal an attitude was followed as was felt to be warranted, and in general it was maintained that as far as the Federal funds were concerned the stations should continue to retain their character of institutions for investigation and its interpretation in practice.

The disturbing influences of war conditions had a noticeable effect upon the stations and their work. Aside from the unusual demands upon them for various forms of service, they experienced considerable difficulty in maintaining their staffs, heavily drawn upon for the Army and for other work incident to the war. The reduction in the total of station officers and assistants, even taking into account the replacements, amounted to more than 15 per cent during the period of the war. This unavoidably had an unfavorable effect on the station work, leading in some cases to the abandonment for the time being or modification of lines of study for which suitable workers could not be secured.

New administrative officers entered upon their work during the year at several of the colleges and stations, and in a number of instances the stations were in charge of acting directors during the absence of the station head on war-emergency or reconstruction duties. Such changes, together with changes in the station personnel, called for special attention to the details of administrative management and policy, the proper safeguarding of the organization and the employment of funds, assistance in filling vacancies, and the like.

The register of persons available for agricultural investigation maintained by the office was of special value to the stations in securing men for their various lines of work, and also to returning soldiers trained in scientific agriculture in locating and obtaining positions.

The office, like the stations, returning during the year to a readjustment basis, found many new matters needing attention, among

them the maintenance of the experiment stations in the proper relative position with respect to other branches of the agricultural work. The key position occupied by the stations as originators and interpreters of the information employed in teaching and extension work emphasizes the prime importance of maintaining them on a basis of progressive strength commensurate with the growth of these other branches.

EXPERIMENT STATION RECORD.

In accordance with the general plan in operation for several years, volumes 39 and 40 of the Experiment Station Record, each consisting of nine numbers and the usual author and subject indexes, were prepared during the year. These volumes contain 7,023 abstracts of the world's scientific literature pertaining to agriculture, together with monthly editorials discussing important phases of the developments in agricultural investigation and brief notes on the progress of institutions for agricultural education and research in this country and abroad.

The total number of articles abstracted was practically identical with that for the previous year. Special attention was again given to the selection of material of immediate usefulness under the war and postwar conditions. Likewise many of the editorial articles took up some phase of the effects of the war on research in agriculture and the opportunities and problems confronting research institutions.

INSULAR STATIONS.

The Office of Experiment Stations, as heretofore, had direct charge of the Federal experiment stations in Alaska, Hawaii, Porto Rico, and Guam, administering their work and expenditures through the local agents in charge.

At the beginning of the fiscal year, and for several months thereafter, these stations were busily engaged in problems connected with increasing production and conservation of food. The policy of agricultural diversification, which has been continued since the establishment of the stations, was fully justified by the results obtained. The stations suffered by reason of the departure of many of their men for military service. The manner in which the remaining members of the staffs took up the additional work is worthy of commendation.

The agricultural experiment station on the Island of St. Croix was taken over on January 1, 1919, becoming the experiment station of the Virgin Islands. This station, with an area of about 200 acres, is to be developed as rapidly as possible to cover all lines of agricultural investigation, and the work is to be extended to the other islands of the group.

The administrative heads of the stations remained without change.

The appropriations for the stations for 1919 were: Alaska, \$65,000; Hawaii, \$45,000; Porto Rico, \$45,000; Guam, \$20,000; and Virgin Islands, \$15,000. These sums constitute the resources of the stations, the current sales funds no longer being available for use.

The stations continued to enjoy the cooperation of the various bureaus and divisions of the department, and their work was greatly assisted in this way. Hearty acknowledgment is made for the aid thus received.

The administrative and financial review of the affairs of the stations in connection with the States Relations Service continued, as formerly, under the supervision of Walter H. Evans and the accounting office of the service.

ALASKA STATIONS.

The Alaska stations continued in direct charge of C. C. Georgeson. Stations were maintained at Sitka, Kodiak, Rampart, Fairbanks, and Matanuska. The headquarters is at Sitka.

At Rampart, practically every variety of spring grain sown in 1918 ripened. Of 76 varieties of spring grain that matured, more than half were hybrids that had been produced at the station. Many of these seem to have become fixed in character and they are being propagated for wide distribution throughout the Territory.

At Fairbanks the yields were less than in some years, but barley yielded 30 bushels per acre and oats 48 to 50 bushels per acre when sown on a field scale. An especial effort is being made to increase the stock of some spring wheats for distribution for seed purposes. These grains were received from the experiment station at Tulun, Siberia, and have proved well adapted to Alaskan conditions. About 65 bushels were distributed in 1918 to be grown for seed purposes, and it was estimated that more than 500 acres of wheat would be sown in the Tanana Valley in the spring of 1919. The station at Fairbanks made milling tests of the various grains, and samples of whole wheat flour produced by the station were given a baking test by the Bureau of Chemistry of this department, which showed the flour to be of high grade. The report on the test states: "This flour makes a very good loaf of bread; in fact, it is one of the best whole wheat or graham flour breads we have had occasion to make."

At the Matanuska station, most of the work is still of a pioneer nature, but quite a little was done with various crops during the year. Cereals sown for grain hay matured, and there was a large production of potatoes of good quality. An attempt was made to grow sugar beets in a small way and analyses of roots sent to this department showed an average sugar content of 15.9 per cent. Experiments to determine the possibility of growing sugar beets for seed were undertaken.

At the Kodiak station, the work with sheep and cattle progressed favorably. The herd of cattle was tested for tuberculosis for the fourth time and no new reactors were found. Of the calves dropped by reacting mothers but reared on pasteurized milk, only one out of eleven showed any suspicious symptoms when tested for tuberculosis.

In an effort to eradicate tuberculosis in cattle, cooperative work was carried on with the Territory in testing cattle in all the more accessible localities, the legislature having made an appropriation for that purpose.

The extension work begun as a war emergency project was continued and considerably expanded. Large quantities of seed and plants were distributed and advice was given regarding the crops that could be expected to succeed and the best methods to be pursued in growing them.

A number of farmers' meetings were held in the Matanuska and Tanana valleys during the year, and were well attended. A recent

report shows there have been taken up, under the various homestead laws, 518 claims embracing approximately 103,840 acres.

The plant breeding and horticultural work at Sitka station progressed favorably and large numbers of hybrid strawberries, and other fruits and plants adapted to Alaskan conditions, were distributed.

HAWAII STATION.

This station continued in charge of J. M. Westgate. While the more formal projects were by no means abandoned, and the importance of diversified agriculture continued to be emphasized, the energies of the station were largely devoted during the year to some of the more pressing problems relating to the production and conservation of food for man and forage for animals.

The chemical division paid especial attention to the conservation of Hawaiian fruits and vegetables. A fruit and vegetable drier was constructed that produced a much better product than that obtained by the usual methods and the practicability of drying bananas and various vegetables was demonstrated. The work with starches attracted much attention, and the commercial manufacture of starch from cassava, edible cannas, taro, and other plants, has been undertaken on several of the islands. The starch of the edible canna was found to be easily digested. A satisfactory method was worked out for the manufacture of vinegar containing 4 per cent or more of acetic acid from waste pineapple juice.

The horticultural work was confined largely to studies of the best varieties of tropical fruits for Hawaiian conditions. A survey was made of the coffee industry as to its condition, its necessities, and also the location of possible sources of caffeine in the pulp prunings, etc., that are now wasted.

The agronomy division has demonstrated the superiority of Guam corn over any other variety grown at low elevation in Hawaii. There is local prejudice against white corn and efforts are being made to cross this variety with some good yellow sort. Important results have been secured in sweet potato breeding work and some promising hybrids are under observation.

The plant pathologist has discovered the cause of a very destructive banana disease and has worked out a seemingly satisfactory method of control. This method, which includes sanitation and spraying, was applied to a 75-acre field with promising results. A comprehensive study of root rots of bananas, pineapples, and sugar cane was begun.

The extension division, through its superintendent on Maui, kept in close touch with the agricultural interests of the islands. Demonstrations were made of the curing of pork, caponizing, increased production of corn, pigeon peas, cassava, etc., and of the practicability of producing concentrated feeds to replace grain brought from California. Corn, calf, and pig clubs were established and a beginning made looking toward organizing farm bureaus for the leading agricultural sections of the islands. The work of the various collaborators was continued and many localities are being reached in this way. During the year an extension agent was appointed for the island of Hawaii.

The cooperative work with the Territorial Food Commission was highly successful and the relations were very satisfactory. The work carried on in cooperation with the War Department at Schofield Barracks was continued and considerably extended, and plans were matured for extensive plantings of forage and other crops suited to the locality. The cooperation maintained between the station and the Territory at the Glenwood station on Hawaii was terminated by failure of the legislature to continue the appropriation which had been made for about six years. Provision was made for continuing the work for a time on a collaborator basis.

The Territorial marketing division, established by the station in 1913 and wholly taken over by the Territory in 1917, was intended to provide a means for the disposal of small quantities of produce and thus foster diversified agriculture. The amount of business of the market increased so rapidly that it was selling about \$20,000 worth of island produce a month. Later the retail privilege was withdrawn, and the legislature at its last session did not continue the appropriation for its maintenance.

PORTO RICO STATION.

D. W. May continued as local agent in charge of this station. The work of the station during the year was directed mainly along two lines, investigation and extension. The investigational work was in continuation of projects that have been in progress for some years. The extension work was carried on through demonstrations, meetings, and the distribution of seeds and plants, literature, etc. One of the important lines of investigation was in connection with the mottled leaf disease of sugar cane. This disease has spread rather widely and threatens to curtail sugar production. The station cooperated with the department in making a study of insects as carriers of the disease, the cause of which is as yet unknown. The question of varietal resistance has been given especial attention. Several years ago the station introduced a considerable number of varieties of sugar cane from other tropical countries and among them are several which show more or less resistance to the disease. Efforts are being made to increase seed cane of one of these varieties as rapidly as possible for planting in the infected portions of the island. As a result of the station's investigations on vanilla a number of commercial plantings, ranging from 1 to 10 acres in extent, have been made. Studies were continued on some of the problems relating to the preparation and marketing of the crop.

The rice work, begun a year ago in cooperation with the Office of Cereal Investigations, has yielded promising results. Nursery and other plants have been planted at the station and about 130 acres were sown in field trials carried on by the station and growers in various parts of the island. The results obtained in 1918 were considered so satisfactory that larger plantings were made in 1919.

In furtherance of work in crop rotations and the use of leguminous plants for food, forage, and green manure, soy beans, and other legumes have been introduced and are meeting with much favor.

The station continued to give attention to the development of the fruit industry, especially citrus fruits, pineapples, mangoes, and avocados. Methods have been worked out in cooperation with the

Bureau of Chemistry for the manufacture of fruit juices, thus making a market for otherwise unmarketable fruits.

Experiments in corn improvement were resumed, attention being paid to local varieties that are already acclimated, and the possibility of increasing the yields through care in seed selection has been shown. Similar work with other crops was begun.

In the extension work 1,741 meetings were held during the year and 500 field demonstrations were conducted. Statistical data were collected which show that in 1918 there were planted 413,158 acres to the 10 most important food crops of the island—corn, with 103,577 acres, and beans, with about the same acreage, leading. The main crops, such as sugar cane, tobacco, coffee, and fruits, are not included.

Previous investigations of the station having shown the practicability of cattle tick eradication, the station having been kept free of ticks for some time, an active campaign was begun to eradicate the tick. Ten dipping vats were constructed and about 80 more projected. The outlook for the success of such a campaign seems promising.

GUAM STATION.

The local agent in charge of the Guam station was C. W. Edwards. The island of Guam was visited on July 6, 1918, by a very destructive typhoon accompanied with heavy rain. Much damage was done to the station buildings, fences, and grounds. A number of the station pigs, goats, and chickens were killed, and practically all crops were destroyed. This necessitated beginning anew with many of the projects in agronomy and horticulture. Seeds and plants had to be secured and much of the material was not received until after the most favorable season for planting. A severe drought, extending from February to June, followed, and the effects of the two unusual conditions were reflected in the station work.

In the animal husbandry work some changes were necessary, due to the typhoon. This was especially true in feeding experiments because of the destruction of nearly all native feeds under test. Shortage of feed made it impossible to continue other lines of investigation. An experiment, in which comparison was made between the native practice of tying pigs under shade trees and confining them in properly constructed pens, showed a decided advantage in favor of penning, and many farmers are now providing suitable inclosures for their swine. In the poultry department most of the young breeding stock was lost in the storm of July 6. Work was continued with a Rhode Island Red-native cross. This cross has met with great favor, is hardy, and of good size, and efforts are being made to establish the strain and produce it in quantity for use by the people in grading up their flocks. The breeding work with cattle and goats was continued as in previous years.

The work with corn has been especially valuable. Much of the station crop was saved after the storm. This and all native supplies which were commandeered after the typhoon were used as seed supplies and most of the corn later planted was station-produced seed. The problem of drying and storing the available seed supplies was successfully worked out with the result that the island government is offering at cost insect and moisture-proof tanks modeled upon those at the station. The two grasses, *Paspalum dilatatum* and Para,

were the only forage to survive the typhoon and later drought, and they supplied about the only source of forage. Plantings of cowpeas made immediately after the storm gave very satisfactory results in supplementing and extending the limited grass pasture.

More than 200 pot tests were begun at the station to determine the crop adaptations and fertilizer requirements of certain peculiar Guam soils. The station distributed more seed and plants to farmers during the year than ever before, the distribution including garden seeds, 6,575 packets; plants, 3,028; seed corn, 7,025 pounds; and large quantities of cowpeas and velvet beans.

In March, extension work was definitely begun by W. J. Green, formerly connected with such work in Oklahoma. Three lines of work were inaugurated, farm demonstration for adults, boys' and girls' club work, and school gardens. The island was divided into 15 patrol districts, and the patrolmen, who were chosen from marines having knowledge of farming, cooperated with the extension department. The insular authorities showed a deep interest in this work and aided it in every way. The demonstration work included crops, live stock, and beekeeping. Within three months after the work was started clubs with 499 enrollments had been organized. The school-garden work had been organized for a longer time and at the end of the year 377 boys were engaged in this work. A garden has been established in connection with every school in the island. The extension agent directs the planting and care of the gardens and the superintendent of schools has charge of the disposal of the produce.

VIRGIN ISLANDS STATION.

In the act making appropriations for this department for the fiscal year ending June 30, 1919, provision was made for an experiment station in the recently acquired Virgin Islands. Arrangements were made through the naval governor to take over the experiment station formerly established by the Danish Government on the island of St. Croix, and on January 1, 1919, the station passed under the jurisdiction of this department and became the Agricultural Experiment Station of the Virgin Islands. The former director, Longfield Smith, was continued in charge, and an entomologist was added to the staff. Considerable repair and reconstruction work was done and equipment was secured.

The work of the station at present consists almost entirely of crop investigations, which are continued along the lines which have been established during the past seven years, including especially experiments of various kinds with sugar cane; cotton breeding; corn selection, crossing, and culture; tests of leguminous crops for forage and for green manure (including velvet beans, Lyon beans, cowpeas, Madagascar beans, alfalfa, and others); and replacement of sugar cane by coconut plantations. Experiments are also in progress with citrus and other tropical fruits, sweet potatoes, etc.

The work thus far has been confined to the island of St. Croix, since it embraces most of the readily tillable land. The islands of St. Thomas and St. John are believed to offer opportunities for stock raising, pineapple growing, sisal production, etc., which should be developed as rapidly as possible. St. Thomas is considered to offer favorable opportunities for various horticultural industries which should be investigated and developed.

OFFICE OF EXTENSION WORK IN THE SOUTH.

BRADFORD KNAPP, *Chief.*

The Office of Extension Work in the South has charge of the co-operative extension work of the Department of Agriculture in the 15 Southern States. Its functions, administrative organization, and relationships with the subject-matter bureaus of the department and with the State extension services were not materially changed during the year.

ADMINISTRATIVE FORCE.

During the fiscal year ended June 30, 1919, there were in the Southern States 15 directors of extension; 15 State agents or assistant directors; 79 assistant State and district agents; 1,031 county agents; 93 assistant county agents; 177 negro agents and 105 boys' club agents; 15 State home demonstration agents; 82 assistant State home demonstration agents and district agents; 763 county home demonstration agents; 250 negro women agents; 50 white women city agents, and 7 negro women city agents.

Within the Department of Agriculture the Office of Extension Work in the South was represented by 1 chief, 1 assistant chief, 5 field agents in the administration of the county agent and co-operative extension work in the States; 4 men and 4 women in the administration of the home demonstration work and the boys' and girls' club work, and the necessary office assistants and clerical force. There were also during the year 10 representatives of subject-matter divisions of the department cooperating with the Office of Extension Work in the South in taking technical information from the Department of Agriculture to the States.

FINANCES.

The total amount available for extension work in the Southern States in 1918-19 was \$6,277,576, exclusive of the amount spent for the support of the office at Washington. Of this amount, \$2,205,500 was from the emergency fund and \$4,072,076 was from regular appropriations to the department, the Federal and State Smith-Lever funds, college funds, and the large appropriations made by various counties.

Taking the figures, without the emergency fund, and averaging the 15 Southern States, we find that 8.1 per cent was spent in administration; 2.1 per cent in printing and distribution of publications; 43 per cent for county agents; 24.7 per cent for home demonstration agents, and 4 per cent for boys' club work, while 18.1 per cent was spent for specialists.

The average percentage of all funds, exclusive of the emergency fund, spent for the three principal projects—county agricultural agents, county home demonstration agents, and boys' club work—was 71.7 per cent. If we add the emergency fund to these figures and take the grand total, the percentages expended for the different lines of work are, county agents, 49; home demonstration agents, 28.8; boys' club work, 3.8; specialists, 11.7; publications, 1.4; and administration, 5.3. The percentage given for specialists does not include the amounts expended for specialists from various bureaus of the Department of Agriculture.

The proportionate amounts expended for county agricultural agents and for county home demonstration agents vary in the different States. In some States less than half as much is expended for home demonstration work as for county agent work, while in one State the sums expended for these two purposes are practically equal.

The following table shows the expenditures for the various lines of work classified under general subjects:

Amounts and percentages of funds allotted to various lines of extension work in 1918-19 in the Southern States.

Line of work.	All funds except emergency.		Emergency fund.		Total.	
		Per cent.		Per cent.		Per cent.
Administration.....	\$331,346	8.1			\$331,346	5.3
Publications.....	86,988	2.1			86,988	1.4
County agents.....	1,750,984	43.0	\$1,328,815	60.3	3,079,799	49.0
Home demonstration agents.....	1,007,450	24.7	801,385	36.3	1,808,835	28.8
Boys' clubs.....	161,543	4.0	75,300	3.4	236,843	3.8
Specialists.....	733,765	18.1			733,765	11.7
	4,072,076	100.0	2,205,500	100.0	6,277,576	100.0

COUNTY AGENTS.

ORGANIZATION.

Each county has an organization cooperating with the county agent and the State extension service in the work of improving agricultural conditions. In the majority of the Southern States these organizations consist of community organizations of farmers and their families, the county organization generally consisting of representatives from such community organization. In the most of the Southern States this county organization is known as the county farm council; in some it is known as the county farm bureau. Two-thirds of all the counties in the South have perfected such organizations within the last few years, while the other third all have the foundation laid in community organizations but have not reached the perfection of organization outlined above. These organizations, with the help of the county agents, both men and women, outline the community and county plans of work and participate actively in the carrying out of the programs undertaken. The main feature of the work undertaken through these organizations is the demonstration conducted by the farmer himself (see p. 369).

Besides these demonstrations, meetings are held from time to time and miscellaneous information is given for the purpose of helping individuals to solve difficult problems.

FINANCES.

The money available for the support of the county agent work during the past year was larger than in any year previous. The total amount of funds devoted to the county agent work in the 15 Southern States in 1918-19 was about \$3,080,000, from the following sources:

Smith-Lever fund, Federal and State.....	\$660,000
Emergency fund.....	1,329,000
U. S. Department of Agriculture, direct appropriation.....	375,000
County and other local funds.....	716,000

The average salary paid to the county agent in the Southern States is about \$2,000. Generally he receives a part or all of his traveling expenses in addition to this.

PLAN OF WORK.

In the South the county agent is recognized as the leader in all of the agricultural extension activities in his county. Through him the efforts of all members of the extension service—State and district agents, specialists from the State agricultural college and the United States Department of Agriculture, and club agents—reach the farmer. The activities of the county agent fall into two main lines, work with men and boys' club work. In the South the boys' club work is one of the main activities of each county agent.

In most instances a written plan of work for the year is prepared by the county agent in cooperation with the district agent, specialists, and the advisory committee of the supporting county organization, and subject to the approval of the cooperative extension authorities. This includes a program of demonstrations, both personal and community, with crops and live stock, special campaigns, field meetings, organization work, marketing, organization of boys' clubs, etc.

RESULTS.

The general effect on southern agriculture of a continuous and consistent program of better balanced farming is now evident. The acreage in corn shows a very great increase during the past 10 years in Alabama, Georgia, Mississippi, and South Carolina. The total corn acreage in the Southern States has increased 17.9 per cent since the year 1909 (census), wheat 150 per cent, oats 98.7 per cent, hay 113 per cent, Irish potatoes 64.5 per cent, sweet potatoes 64.6 per cent, rice 32.3 per cent, peanuts about 100 per cent; grain sorghums have increased, from 1915 to 1919, 26.7 per cent in Texas and Oklahoma alone, and velvet beans increased from a small acreage in 1910 to 4,318,000 acres in 1918. The acreage of cotton in 1918, though large, was exceeded three times during the past 10 years.

The live-stock industry in the South has had a similar experience. The growing of more hay, forage crops, and grain, especially corn, soy beans, peanuts, oats, and velvet beans, has greatly increased the production of both hogs and cattle. Dairy cows have increased in the Southern States 10 per cent since 1910. Owing to the protracted drought in western Texas and Oklahoma, the actual number of "other cattle" in the South shows a slight decrease. One-third of all cattle in Texas had to be marketed during 1917 and 1918 to keep them from starving, owing to the most disastrous drought in the history of the western territory. In the sections east of Texas a very large increase is shown.

The campaign for more hogs, with the effective demonstrations put on by the pig-club boys, has greatly advanced the hog industry in the Southern States. Cooperative carload shipments, fostered by the county agents, had a very distinct effect in stimulating this industry. Since 1910 the total number of hogs in the Southern States has increased 31 per cent. Of the 20 highest States in the point of hog production in the United States, 10 are Southern States.

DEMONSTRATIONS.

The corner stone of the county agent work in the South is the actual demonstration conducted by the farmer on his own land with the help of the county agent and specialist. More often than not the demonstration is on a community basis, that is, the farmer conducting the demonstration does so for the purpose of illustrating better practices to himself and to his neighbors. The effect of the demonstration is often very materially increased by the fact that neighbors are copying the practices on their own farms. The total number of acres in crop demonstrations in 1918 was 3,207,848. The total number of farmers demonstrating was 317,509.

The largest acreage in demonstrations with one crop was in corn. More than 70,000 demonstrators cultivated a total of 774,449 acres under special instruction, with an average yield of 35 bushels an acre, more than doubling the average of the whole territory.

There was a great increase in the number of wheat demonstrations. In 1917 there were 19,741, while in 1918 there were 50,310 such demonstrations on a total acreage of 317,948, the average yield being 19.7 bushels per acre.

There was also an increase in rye and peanut demonstrations.

ORCHARDS.—There were nearly four times as many demonstrations in orchards in 1918 as in the year before, there being 19,789 demonstrations with a total number of 705,690 trees. County agents gave advice and counsel regarding pruning, spraying, and otherwise treating 45,716 orchards, involving a total of nearly 5,000,000 trees.

LIVE STOCK.—In 1918 the county agents assisted farmers in bringing in 4,395 head of horses and mules and, with the assistance of specialists, conducted 859 feeding tests, involving 3,821 animals. They helped bring in 12,647 head of pure-bred dairy cattle and 14,997 grades. They helped the specialists in dairying to conduct 1,052 feeding demonstrations, involving 19,200 animals. Outside of the special work in the removal of cattle from the drought-stricken region of Texas and Oklahoma, they assisted in bringing in 17,807 head of purebred beef cattle and 40,183 head of grades. There were 805 feeding demonstrations with beef cattle, with a total of 28,317 head involved. The county agents started 2,195 herds of beef cattle. They assisted farmers in bringing 42,864 head of hogs into the South for breeding purposes, and helped specialists to conduct 7,884 feeding demonstrations, involving 71,901 hogs. The special campaign for increased hog production asked for by the Government was conducted in all States. The allotted percentages of increase were fairly well met, Mississippi and Tennessee leading, each with a 20 per cent increase. The agents helped bring in 10,775 pure-bred sheep and goats, and 69,862 grades, and conducted feeding demonstrations on 367 farms, involving 8,026 animals. In addition, they started 3,526 new herds.

POULTRY WORK.—County agents assisted specialists in conducting poultry demonstrations on 4,623 farms, involving the feeding of 474,397 birds.

LIVE STOCK DISEASES.—To help farmers protect their herds against live stock diseases and pests the county agents induced farmers to se-

cure the treatment of animals for diseases, as follows—2,391,842 head of cattle and 2,299,661 hogs. In this they personally treated 568,167 head of hogs for cholera while administering either the simultaneous or serum treatment, in most instances under authorization of the State live stock sanitary boards. They induced farmers to have 43,396 head of sheep and 43,242 head of horses and mules treated for diseases. The grand total of live stock so protected was 4,778,141 head. In addition to this, they helped procure the building of 2,219 dipping vats and 3,803 silos.

TICK ERADICATION.—The Bureau of Animal Industry, in cooperation with the various State live stock sanitary boards, has been conducting an intensive campaign for cleaning the South of cattle ticks. There were released from quarantine 67,308 square miles of territory during the year. More than half of the original quarantine area is now released. Mississippi was declared tick free and South Carolina expected to be released November 1, 1918. County agents everywhere have assisted the specialists in the necessary educational work and in stocking the country with improved animals after the ticks have been eradicated.

MANURE, FERTILIZERS, AND LIME.—The county agents conducted 63,085 demonstrations in the proper care and saving of manure on farms, estimated to involve over 10,000,000 tons. The county agents assisted farmers and farmers' organizations in the cooperative purchase of lime and in lime demonstrations, involving practically 1,000,000 tons. They gave specific advice to 223,979 farmers regarding the use of fertilizer and conducted 11,665 specific demonstrations. They also induced 2,156 communities or organizations of farmers to purchase fertilizer cooperatively. The value of the fertilizer so purchased by these organizations was \$3,630,195, and the estimated saving due to cooperative purchasing was \$532,106.

GARDENS.—A part of the general work in the Southern States in 1918 was the campaign for home gardens. Other forces were in the field, but the county agents organized this movement in practically every county in 1918, and the success of the movement was due mostly to them. Special agents in charge of the garden work were appointed for the States of Alabama, Georgia, Louisiana, Maryland, North Carolina, Oklahoma, South Carolina, Tennessee, and Virginia. In all of the other Southern States the specialists in horticulture and the county and district agents conducted the campaign. Under war conditions this campaign was definitely aimed at city and town gardens as well as rural gardens. Complete data are not available, but it is estimated that a total of more than 3,000,000 gardens in the South were the result of this campaign.

COOPERATIVE MARKETING AND PURCHASING.—The statement often made that the colleges, the county agents, and the United States Department of Agriculture put all of their emphasis on production and are not assisting the farmers with the difficult problems of marketing may be answered by saying that the county agents have everywhere worked with bodies of farmers organized for the purpose of purchasing farm supplies and marketing farm products. Where the marketing problem has been critical, the county agents have not hesitated to quickly assist farmers and farmers' associations to

organize on the proper basis for making purchases or marketing products. The South is just building its new agriculture, and in this building problem many difficulties regarding the marketing of the new products have arisen and all of the extension forces have realized that it was necessary to help farmers to solve these problems. This the marketing specialists and county agents are doing. The Bureau of Markets of the department has a specialist in marketing, either in direct or very close cooperation with the extension forces of the colleges, in the following States: Virginia, North Carolina, South Carolina, Georgia, Mississippi, Louisiana, Arkansas, Tennessee, and Kentucky.

There have been many reasons for greatly extending marketing efforts, as for example, the increased production of hogs and cattle in the South, the necessity for organizing new systems to take in farm products locally produced and distribute them to local markets, the increased production of food and feed which had to be distributed through local organizations, the drought conditions in western Texas and Oklahoma, and the Government sale of nitrate of soda.

The main items of business of this kind, in which the county agents assisted, were as follows:

Fertilizer, lime, and the like, purchased amounted to 64,382 tons valued at \$1,906,122, exclusive of nitrate of soda; carloads of cattle marketed 751, valued at \$1,031,295; carloads of swine marketed 1,530, valued at \$2,748,918; corn, wheat, and other grain marketed 1,395,960 bushels, valued at \$1,590,448; miscellaneous agricultural products marketed valued at \$2,631,985. The grand total value of the work was \$17,156,232, and the saving \$2,834,067, or about 16 per cent.

HOME DEMONSTRATION WORK AND GIRLS' CLUB WORK.

The home demonstration work was organized for the purpose of giving the same service for women and girls on the farm which the county agent performs for the men and boys. It is organized as a definite part of the State extension service, and represents the cooperative effort of the State agricultural college and the United States Department of Agriculture, and counties and communities. In the majority of the States in the South the home demonstration division of the extension service carries the entire extension work for women and girls. The work is organized on much the same basis in all the States. There is a woman in charge of the work in every State. In Virginia, Tennessee, North Carolina, South Carolina, Georgia, Florida, Mississippi, Louisiana, Texas, Oklahoma, and Arkansas she is practically an assistant director, responsible to the director of extension, and in charge of the home demonstration work for women and girls.

Organization has been moving along rapidly. All extension agents recognize that an organization in the community, representing all the activities, is the ideal organization. The problem of county organization for extension work is discussed under the county agents' work (p. 1484). The home demonstration work has been gradually fitted into the organization. In many counties either a women's section of the county agricultural council has been organized or a women's advisory committee has been established. In all cases the

work is founded on community effort. The home demonstration work is organized on the basis of clubs of women and girls, often, though not always, representing a community organization.

The Southern States had last year 6,391 clubs of rural women, with a regular enrollment of 325,229 and an emergency enrollment of 1,518,746 women; 9,028 girls' clubs, with a regular membership of 146,102 and an emergency enrollment of 759,373; 1,563 clubs for rural negro women, with a membership of 37,913; and 1,822 clubs for negro girls, with a membership of 50,995. There was an emergency enrollment of negro women and girls in these clubs of 247,143, of which about one-third were girls and two-thirds women. In addition to these, there were 1,179 organized communities of city and town women in the urban work, with a regular membership of 119,218, and an urban enrollment among negro women in cities and towns of 224 clubs with a membership of 1,035. In addition to these, there were 2,751 poultry clubs of white women and girls, with a membership of 63,481, and there were 13,434 negro women and girls taking poultry work. This makes a grand total of 23,096 regular clubs of women and girls. The total regular and emergency enrollment was 3,283,669. A little over 2,000,000 of these are women and a little over 1,000,000 are girls. This represents the total number of people enrolled but does not represent the total number of persons reached, as it does not include those in attendance upon lectures, extension meetings, demonstrations, exhibits, etc., who were not enrolled in some club.

Such a large enterprise naturally resulted in many interesting and constructive pieces of organization work. In all of them the home demonstration agent was represented and in most of them she was the leading figure. During the year 1918 in the 15 Southern States there were established 855 community canneries; 639 community demonstration kitchens, where women gathered to receive instruction; 131 community drying centers; 137 rest rooms in cities and towns for the benefit of farm women; 173 egg circles for cooperative sale of poultry and eggs; 211 cooperative breeding associations engaged in the improvement of poultry; and 20 free curb markets were organized where farmers and farm women and girls come to dispose of their products directly to housekeepers.

PURPOSE AND PLAN OF THE WORK.

The whole purpose of the work was to reach, through organization, the largest possible number of women and girls and give them direct assistance in problems of production, conservation, and utilization of food, and in the preservation of health, prevention of disease, introduction of labor-saving devices and home conveniences, beautification of the home and its surroundings, cooperative and individual marketing of products, and thrift and saving from the family income.

This program included gardening, canning, drying, and brining; production of butter and cheese for home use and for market; production and marketing of eggs and poultry; purchase and home manufacture of labor-saving equipment; home management; utilization of home-produced and other foods for a healthful diet; saving

of wheat, meat, sugar, and fats; conservation of clothing; development of community enterprises, such as canneries, drying plants, demonstration kitchens for instruction, and curb markets; and co-operative marketing of products.

In all of this work there were three main objects—first, production; second, economy and thrift; and third, health. Along with the other work considerable attention was given to recreation, social enjoyment in the club meetings, and the general improvement of rural conditions.

RESULTS.

The total number of containers of vegetables and fruits put up during 1918, under the direction of the home demonstration agents, was 64,604,531, valued at \$15,566,456.15. The women enrolled as regular members of clubs, whose work was intensive and thorough, put up 23,528,345 cans, while the regular enrollment of girls put up 10,497,768 cans; 2,654,607 cans are to be credited to the urban work and 19,334,583 to the emergency enrollment. Rural negro women put up 1,073,663 cans and negro girls 430,314 cans; the city negro women 456,470 cans, and the negro emergency enrollment 2,314,776 cans. A very large proportion of the vegetables canned were produced from the home gardens and from the tenth-acre plats of the members of the girls' clubs. Eight hundred and fifty-five community canneries were established for operation on a cooperative basis. A great contribution to the food resources of the South was made during the war as a result of this work of the women and girls.

Besides the millions of home gardens, 91,000 demonstrations of winter and perennial gardens were established and conducted by women and girls to illustrate all-the-year-round food production.

It is difficult to say what proportion of the emergency work should be credited to the girls and what proportion to the women, but it is probable that about one-third of the emergency canning should be credited to the girls. In no other year in the history of the work in the South has so much been done along this line, and the results are to be attributed to the enthusiasm and energy of the agents and to the wonderful organization and devotion of the women and girls who contributed toward these results.

The work in home drying of fruits and vegetables for future use initiated in 1917, owing to the scarcity of cans, advanced very materially during the season of 1918. The total amount of dried fruits and vegetables prepared and stored was 8,932,787 pounds, estimated to be worth \$1,846,625.56. The women established 131 central plants for community drying.

The results in brining and pickling were beyond expectations, about 1,006,222 gallons of vegetables, valued at \$382,808.73 having been preserved and saved. Rural women in the regular enrollment put up 336,872 gallons, and in the emergency enrollment 447,292 gallons. The balance was put up by the girls and a small amount by the negro enrollment.

The agents' reports show that the women enrolled in the work in 1918 produced 16,507,711 pounds of butter and 939,603 pounds of cottage cheese. A considerable proportion of this butter was sold locally and brought an average of 17 cents per pound above the market price for ordinary butter.

During the year 1918 there were organized 173 egg circles and 211 cooperative poultry breeding associations. Through these organizations approximately 1,592,357 chickens were raised and 575,593 dozens of eggs marketed cooperatively and 198,427 dozens individually. The value of the eggs marketed was a little over \$300,000. They marketed 1,148,738 pounds of poultry, valued at \$311,558.82. The agents also report 130,297 dozens of eggs preserved in waterglass.

The home demonstration agents worked in close cooperation with the Food Administration in the conservation of wheat, meat, sugar, and fats, and deserve a fair share of the credit for the success of this campaign.

In addition to these lines of work, household conveniences, labor-saving devices, and equipment of various kinds were placed in thousands of homes, farm women and girls were assisted in the conservation of clothing, and many other things were done to improve the health, beautify the home, and make country life more attractive.

BOYS' AGRICULTURAL CLUBS.

The boys' agricultural club work surpassed all previous records. Stimulated by a spirit of patriotism and assisted by the emergency appropriation, the boys' club enrollment increased from 115,746 in 1917 to 407,540 in 1918, including the emergency members. The grand total production of the clubs, including emergency members and farm makers' clubs for negro boys, was \$12,034,271.27. The average yield of corn grown by club members was 42.8 bushels, while the average for the Southern States was 19.4.

The demonstrative value of club work is being felt throughout the South. Boys' club work has not only gone a long way toward definitely directing and applying the rural boy power of the South into channels of useful work, but their intelligent application of experimental data has in many instances demonstrated to the adult farmer the value of improved methods.

EXTENSION SPECIALISTS.

The agricultural extension work centers around the county agent. It is through him that the great store of information regarding better farm practice is carried from the United States Department of Agriculture and the State agricultural colleges and experiment stations to the large body of farmers scattered through the States. It is also through him that the unsolved problems arising on the farm are brought back to the experiment stations and the department for their solution. It is obviously impossible for the county agent to have a broad enough knowledge of the various sciences necessary to solve, offhand, all of the problems arising in a county with its great variation of crops, live stock, soils, plant diseases, and the like. That the county agent may be able to assist in the solution of these problems, each State maintains a force of specialists whose duty it is to furnish the county agent definite information on matters pertaining to their particular line.

It is very gratifying that as the extension work progresses a better understanding of the relationship between the specialist, the county agent, and other extension workers has developed with it. It is being more clearly recognized that there must be a definite interlock-

ing of the efforts of all members of the extension force if the organization is to function to the greatest advantage. To this end, in practically all cases, the specialist and the county agent are planning their work cooperatively. The specialist maps out, in project form, various kinds of demonstrations designed to meet the problems arising in his particular line. The county agent selects from these projects those particularly applicable to his county. The farmer who conducts the demonstration is selected by the community club or volunteers his effort for his own good and that of his neighbors. The selection is approved by the county agent and the specialist.

Specialists have also rendered effective service by speaking and giving practical demonstrations at meetings, arranging and looking after exhibits at fairs, and assisting in the judging of these exhibits.

NEGRO WORK.

Work with negroes was continued along the same general lines as in previous years with a small increase in the number of agents. As a rule the negro agent is appointed assistant to the white agent so that the regular county agent has general supervision of the work. In counties without negro agents the regular county agent does considerable work with negro farmers so that they receive the benefits of the extension work even though they have no agent working directly with them.

In most of the States, cooperative relations have been perfected between the negro agricultural colleges and the extension division of the college for whites. The negro in charge of the negro agents has his headquarters at the negro agricultural college. The work with negroes has been very effective in stimulating the production of home supplies, especially the home garden. In some States marked progress was made in encouraging negro farmers to keep a cow for supplying milk and butter to their families, and the raising of pigs to supply meat.

OFFICE OF EXTENSION WORK IN THE NORTH AND WEST.

C. B. SMITH, *Chief.*

ADMINISTRATION.

The Office of Extension Work in the North and West has charge of the cooperative extension work of the department in the 33 Northern and Western States. Its administrative duties, organization, and relationships were not materially modified during the year.

Many important administrative questions were handled. In the first few months these problems had to do with the organization and direction of war emergency extension activities, so that not only increased food production but also strict food conservation might be attained. In addition, methods of clothing conservation were given the careful attention they merited. All these activities were conducted in such a way that the permanent improvement of agriculture and home-making conditions, methods, and practices might result. After the signing of the armistice numerous problems arose out of the changed agricultural economic conditions, the return to a peace program of work, and the adjustment necessary because the special

war emergency funds were not to be available after the end of the fiscal year.

Each of the Northern and Western States was visited as usual during the year and the expenditures of the Smith-Lever funds examined, conferences held with the extension director and his staff, and progress and plans of work discussed.

COUNTY AGENT WORK.

This section continued under the immediate charge of W. A. Lloyd. The number of counties employing agents on June 30, 1919, was 1,106, approximately the same as on June 30, 1918. In addition, there were 45 district agents, covering 105 counties, and 104 assistant county agents. The number of county agents reached its maximum about December 1, 1918, at which time there were 1,136 county agents, 52 agents in larger districts covering 156 counties, and 61 assistant county agents. At that time approximately 82 per cent of the agricultural counties in the 33 Northern and Western States were being reached. In a few counties where the work was started in cooperation with county councils of defense the county agents were discontinued shortly after the signing of the armistice because of lack of local funds.

COUNTY AND COMMUNITY ORGANIZATION.

The rapid appointment of agents during 1917 and 1918 made impossible thorough organization in many of the counties. The past year witnessed a great intensification of county and community organization. The development of community programs received special emphasis. The initiative and cooperation of the people of each community were carefully nurtured, and by conferences with community leaders local extension programs were developed. Although the number of county extension organizations did not increase materially from the 775 on June 30, 1918, the membership increased from approximately 300,000 on that date to 409,841 on March 1, 1919. More important, however, was the organization of community committees. No data are available as to the number of such committees on June 30, 1918, but it may be conservatively estimated that more than one-half of the 8,575 community committees existing on June 30, 1919, were organized during the past year. Better understanding was established and maintained with local farmers' organizations, and their machinery was freely lent to the furtherance of the extension program.

DEMONSTRATIONS.

Field demonstrations continued to be the basis of the work. Although during the summer of 1918 definite demonstration work was much interrupted by special or "war work," 77,668 demonstrations were conducted incident to crop and live-stock production. Almost every phase of agriculture where the need of more efficient production was apparent or made evident by a study of local conditions was touched.

The meeting at the demonstration plat is probably the most effective teaching agency. Through it farmers see the effect of the method or practice advocated and determine its application to their

farms. During the year 677,653 people attended such demonstrations conducted by the county agents. The increased profit on demonstration areas alone, due to the better practices, amounted to \$22,206,307, or more than five times the total cost of the work.

WAR WORK OF COUNTY AGENTS.

The county-agent system was expanded as a food production stimulation measure through special funds appropriated by Congress. The county agents thus became the local agencies for propaganda work of this character by both the Nation and the States. A great number of other agencies also sought and secured cooperation.

The following is a partial list of the ways in which the county agents assisted the various departments of the Federal Government and others during the year 1918-19:

The agents secured information as to farm-equipment prices; made surveys to determine farm labor supply, financial condition of farmers owing to crop failure, increase in use of farm machinery, and use of tractors on farms; ascertained the number of farmers in each draft class and the surplus or shortage of labor in each class; assisted in arranging seed loans to farmers in drought-stricken areas in Montana, Kansas, and other States; placed farm help; and promoted campaign for standard width of farm vehicles. For the Bureau of Markets they made a survey to determine the amount of wheat and other cereals thrashed; assisted in securing reports from thrashermen, in wool marketing, and in collecting data regarding the price of wool and hides; made a survey of the retail markets; secured samples of spring wheat and lists of cheese factories; made a survey of the needs of farmers for nitrate of soda and distributed nitrate; collected data regarding the marketing of sweet potatoes and food supplies in homes; collected feed-supply reports; made a lime survey; redistributed sheep and cattle; facilitated wheat marketing; distributed information and gave assistance in connection with the shipping of potatoes; promoted storage of vegetables; and assisted in the movement of cattle from drought-stricken regions of Texas to Northern States. For the Bureau of Plant Industry the agents made surveys to determine the extent and damage of cereal and potato diseases, condition of the clover seed crop, number of farmers raising vetch, distribution of sweet-clover acreage, and acreage of war gardens; located, secured, and distributed seed corn; distributed and introduced new plants and disease-resistant seed; and assisted in control of white pine blister rust and barberry eradication.

The Bureau of Animal Industry was assisted by the agents in the control of animal parasites and hog cholera, in surveys of contagious diseases in cattle, in locating available supplies of alfalfa and clover hay, in the cottage-cheese campaign, in securing a list of sheep feeders, and in moving cattle from drought-stricken areas. The Bureau of Entomology was assisted in surveys to determine damage done by the Hessian fly, bean weevil, codling moth, and by insect pests of cereals, truck crops, and fruits; the presence of nematodes in grain; and the number of farmers keeping bees. The Bureau of Crop Estimates was assisted in securing crop reports, in the determination of winter and spring wheat acreage, in securing lists of

buyers of farm products, and in making surveys of live stock and the pecan crop; the Bureau of Chemistry in carrying on potato flour experiments; the Bureau of Soils in making soil erosion and local price of fertilizer surveys, and in determining the need of farmers for potash; the Forest Service in encouraging the use of national forests for grazing, and in making surveys of land adjacent to national forests to determine the dependence of ranchers on forests; the Biological Survey in campaigns for control and eradication of gophers, jack rabbits, ground squirrels, moles, rats, and other predatory animals; and the Office of Farm Management in attending to many details in connection with the farm-labor survey.

The county agents assisted the War Department in securing castor-bean contracts, labor for construction of camps, and spruce for aircraft production; locating walnut timber; purchasing horses, mules, hay, and straw for the Army; collecting fruit pits for gas masks; considering deferred classification for farmers and soldiers' furloughs; placing conscientious objectors on farms; determining the number of farmers disabled by loss of limbs in operating farms; and securing list of shoe dealers.

They assisted the Treasury Department in miscellaneous activities connected with Liberty loan and war savings stamp campaigns; in the influenza work of the Public Health Service; and in the organization of farm loan associations by the Farm Loan Bureau.

The employment service, the Children's Bureau, and the Labor Reserve of the Department of Labor were assisted by the agents.

For the Council of National Defense county agents made a survey to determine motor transportation routes; cooperated in thrift and conservation campaigns; made report of owners of thrashing outfits; assisted in distributing machinery, establishment of fair prices, and inspection of thrashing and routing of thrashing machines; and secured information regarding wool prices.

The Food Administration was assisted in taking a hog census; in determining prices of foodstuffs, dairy products, and dairy feed; in securing a list of bean growers; in obtaining data regarding milk production; in the food pledge campaigns; in the sale, sampling, and inspecting of beans and stimulating their production; in listing grist mills; in wheat inspection and grading; in food conservation campaigns and use of food substitutes; and in securing lists of stock feed used by farmers.

For the Fuel Administration the agents made surveys of materials used for fuel and secured lists of fuel dealers and public buildings using coal.

The agents cooperated with the agricultural development department of the Railroad Administration.

They made a survey of the price of farm machinery for the Federal Trade Commission.

The agents also assisted the Red Cross in making a survey of nurses and in its relief work and campaigns for funds, and a woman's organization in determining opportunities for work and organization.

CROP PRODUCTION WORK.

Special crop production campaigns were conducted in connection with most of the crops commonly grown, special attention being paid

to stimulating increased acreage and locating and securing good seed. The table below summarizes some of this work.

Some results of the increased food production campaign of county agents.

Crop.	Farmers assisted in securing or locating seed.	Seed secured or located for farmers.	Additional area seeded as result of special campaigns.	Estimated total production on additional acres.
		<i>Bushels.</i>	<i>Acres.</i>	<i>Bushels.</i>
Spring wheat.....	48,854	831,566	1,415,901	21,258,695
Winter wheat.....	28,963	1,119,163	2,724,561	23,902,678
Oats.....	14,142	421,660	182,507	4,893,610
Corn.....	222,123	1,232,099	597,720	12,820,300
Rye.....	11,532	183,595	258,790	1,705,806
Buckwheat.....	2,186	23,601	17,055	331,485
Barley.....	6,333	159,493	122,569	2,827,995
Potatoes.....	9,294	358,779	32,609	2,157,712
Beans.....	4,785	29,578	40,528	247,088
Total.....	348,212	4,359,534	5,392,240	70,145,369

CORN.—The unfortunate seed condition for two preceding years made special emphasis on seed selecting and testing necessary in the fall of 1917 and the spring of 1918. In the fall of 1917 county agents arranged for field selection on 326,662 farms involving sufficient seed for 3,466,986 acres. As the result of campaigns in the spring of 1918, 547,779 farmers tested seed and 10,605,894 acres were planted with tested seed. Reports from agents indicated a stand of corn much above the average in 1918. The seed selecting campaign was renewed in the fall of 1918 and resulted in the field selection of 4,718,691 bushels of seed. The county agents reported a total increased production of nearly 13,000,000 bushels as the result of all campaigns incident to corn.

OATS.—Ninety-seven thousand nine hundred and eighty-three farmers treated seed oats for smut following the agents' directions, and the total acreage seeded with treated seed amounted to nearly 2,000,000 acres. The increased net profit due to seed treatment averaged about \$2 per acre on several thousand demonstration fields where careful records were kept.

HOME AND COMMUNITY GARDENS.—Work in connection with home and community gardens was carried on in both town and country. More than 225,000 families were given direct assistance in connection with home gardens. No estimate is possible of the value of the increased food supply. As a by-product of these campaigns, however, 3,588,070 quarts of fruits and vegetables were canned and 753,389 pounds dried. The agents conducted 6,894 canning demonstrations and furnished information to 149,282 families in regard to storing fruits and vegetables.

LIVE STOCK WORK.

Assistance in sanitation and demonstration of disease control methods continued a prominent phase of the work with live stock. The work was done wherever possible in cooperation with local veterinarians and State and Federal control agencies, the county agent's part being to demonstrate the usefulness and helpfulness of approved

methods. These demonstrations involved the testing of 55,962 animals for tuberculosis, and the vaccination of 380,264 animals for blackleg and 523,189 hogs for cholera.

FARM BUSINESS.

Seventeen thousand eight hundred and thirty-five farmers kept records of their business on blanks furnished by the State farm management demonstrators. The county agents assisted 6,860 of these in closing their accounts. Profitable changes in their farm management were made by 3,444 farmers as a result of records kept.

The county agents assisted in the organization of a large number of cooperative associations for buying farm supplies and selling farm products, and by cooperating with groups of farmers and other agencies in determining the cooperative enterprises needed and obtaining the expert attention necessary to put the enterprises on a sound business basis. The associations are followed up from year to year in an effort to prevent the mistakes which so often cause failure of such enterprises. The total value of cooperative business of farmers' exchanges and cooperative associations organized by county agents in this and preceding years amounted to \$41,877,783. The saving effected amounted to more than \$4,500,000. Three hundred and thirty-two Federal farm loan associations were organized by agents and 19,312 farmers were assisted in securing credit for the purchase of seeds, machinery, fertilizers, and other supplies. The agents helped in meeting the labor situation by the locating of 151,532 men for work on farms.

In carrying forward the various projects and campaigns the agents made more than half a million farm visits, the average number of farm visits per agent being 435.

The spring of 1919 brought serious readjustment problems owing to the prospect of peace brought about by the signing of the armistice. These can only be worked out gradually, though in the main their solution appears to mean a return to normal farm practice with an emphasis on the organization of the farm as a profitably productive business.

EXTENSION WORK WITH WOMEN.

This work continued under the direction of Miss Florence E. Ward. The activities during the year were characterized in every phase by a transition from war-time problems to those of readjustment and peace.

ORGANIZATION.

On June 30, 1918, the home demonstration force in the field numbered 790, including 31 State leaders, 361 agents, and 32 assistant agents in counties, 98 agents in districts, and 107 urban and assistant urban agents. Of this number, about 100 were temporary appointments. On June 30, 1919, workers numbered 582, including 32 State leaders, 329 agents, and 21 assistant agents in counties, 22 district agents, and 98 agents and assistants in cities.

During the war agents were installed without any permanent organization in many counties and districts that provided the required sum for local expenses. Since the war fruitful efforts have been made to establish the agent as an employee of a permanent county organ-

ization in which women have membership and representation on the executive board. In 17 States the work is an integral part of that of the farm bureau; in some others it is conducted as a department of the farm bureau, called home department, women's department, or home bureau. In Illinois and Wisconsin it is organized apart from the farm bureau.

Progress was made in developing county and community programs of work, putting the work on a project basis, and training county and community project leaders. An outstanding feature has been the use of carefully selected and trained volunteer leaders in food production, food preservation, use of war substitutes, clothing, and poultry culling.

In some States, where county funds could formerly be appropriated only for county agent work, legislation has been enacted permitting appropriations for home demonstration work. In many counties the women themselves have secured a considerable increase in local funds necessary to continue the home demonstration work.

Home demonstration work in cities was considered a war measure and no permanent organization was at first attempted. Funds for local expenses were furnished by national, civic, or other organizations, and the agents cooperated with all existing organizations. With the signing of the armistice the development of permanent home bureaus was undertaken in many cases, and on June 30, 1919, there were 20 such bureaus in various stages of development, with more planning to organize in the autumn. Like the farm bureau, the home bureau is based upon a program of work developed by the people of the community, with each project or activity of the program in charge of a community project leader. The home bureaus of Buffalo and Syracuse, N. Y., have paid memberships numbering 930 and 830, respectively.

Besides their emergency service as leaders in food preservation and conservation, urban agents made records along the lines of child feeding, clothing, and thrift work, cooperated in putting on far-reaching milk campaigns, and started canning kitchens, soup kitchens, milk stations, information centers, hot school lunches, and neighborhood centers that have been taken over by municipal authorities or welfare organizations. The most effective work seems to have been done with wives of wage earners, women of foreign extraction, and women employed in industry.

FOOD PRODUCTION, CONSERVATION, AND UTILIZATION.

For the year ended November 30, 1918, the State leaders reported 570 training classes for local leaders in food production and 12,960 in food preservation; 750,000 persons reached by lectures, demonstrations, and home visits; over 1,400 exhibits held; more than 100,000 home gardens planted; more than 100,000 pounds of cottage cheese made in homes; and a marked increase in the efficiency of home poultry flocks, through poultry culling. Food was preserved by those whom agents influenced as follows: 12,532,205 quarts of fruit, 2,572,757 quarts of fruit products, 8,982,461 quarts of vegetables, 269,717 pounds of meat, and 46,380 pounds of fish canned; 344,001 pounds of fruit and 804,565 pounds of vegetables dried; 2,200,000 quarts of vegetables brined; and 462,307 dozens of eggs preserved. Community food enterprises were established with the

advice and assistance of home demonstration agents as follows: 445 canning kitchens, 33 drying establishments, and 93 demonstration kitchens used as instruction centers; 46 cooperative buying associations; 31 cooperative selling associations; 14 curb markets, with sales amounting to \$67,533; and 10 milk stations.

Home demonstration agents gave 27,000 lectures and demonstrations on food selection and the use of war substitutes, and made 37,663 home visits in this connection, reaching over 2,250,000 persons. In addition, they prepared 3,000 exhibits, attended by over 2,700,000 people.

After the armistice, the agents responded to the widespread demand for instruction in food selection, placing special emphasis on child feeding and hot school lunches.

MILK CAMPAIGNS.

Urban home demonstration agents in Michigan, Massachusetts, Connecticut, Rhode Island, and New Jersey, and rural agents in Iowa, Kansas, and Utah took part in vigorous milk campaigns carried on cooperatively with the Dairy Division of the Bureau of Animal Industry, the object being through educational work to stimulate the production and consumption of milk and milk products for human food. This project was timely in view of the records showing progressive malnutrition of children in the United States during the last few years. Records kept by schools showed the effects of an increased use of milk in the diet of undernourished children. Milk talks were given in factories and milk sales increased from 5 to 35 per cent, factory managers permitting distribution of milk at cost to employees during working hours. Stations for the distribution of whole and skimmed milk were also established. The board of health of New Haven, Conn., states that infant mortality decreased 50 per cent in the last year in one factory district in which such a station was established.

IMPROVED HOUSEHOLD EQUIPMENT.

Rapid progress was made in introducing homemade and commercial labor savers, including fireless cookers, pressure cookers, and iceless refrigerators. On December 1, 1918, the State leaders reported 228 water systems and 198 lighting systems installed, 4,281 houses screened, 1,002 kitchens remodeled, and 9,563 pieces of improved equipment installed as a result of the work of the home demonstration agents.

INFLUENZA SERVICE.

During the influenza epidemic, home demonstration agents were called on to assist in important emergency work, such as organizing soup kitchens (49 reported), emergency hospitals, and volunteer nursing services; or to act as hospital cooks and dietitians. Many agents organized classes in home nursing, in connection with State home nursing specialists, local nurses, or doctors, or the Red Cross nursing service.

POULTRY.

In Connecticut, Delaware, Idaho, Illinois, Missouri, and Vermont home demonstration agents played a prominent part in intensive

culling campaigns inaugurated by Federal and State poultry specialists. In one county 250 women culled flocks totaling 23,550 birds, discarding about 40 per cent and saving \$19,000 on feed. Canning of surplus culls and preservation of eggs in waterglass were widely demonstrated. Agents also took up other phases of poultry work.

SPECIALISTS.

A member of the Washington staff delegated to study the work of home economics extension specialists visited 14 States and held conferences with State leaders and specialists and reported upon the work. Fifty home economics extension specialists were employed in 15 States to give instruction and demonstrations in foods and nutrition, clothing, home hygiene and sanitation, household management and conveniences, home decoration, and other subjects. An almost equal number of women who were virtually specialists assisted in such work in the 18 other States.

BOYS' AND GIRLS' CLUB WORK.

The boys' and girls' club work continued in charge of O. H. Benson. Marked progress was made during the year in the employment of paid club leadership. Twenty-eight State, 131 assistant State, 57 district, and 736 county club leaders were employed, in addition to which there were 13,988 volunteer club leaders in charge of local groups. There was a steady tendency toward employment of full-time county club leadership. During the year 31 per cent of the 1,596 counties in the Northern and Western States had paid club leadership, and 21 per cent of all the counties had full-time county club leaders, where the previous year only 16 per cent of the counties had such leaders. The number of full-time county leaders on the rolls on June 20, 1919, was 272.

During 1918 cooperative club leaders conducted 31,336 demonstrations in food preservation and other club projects. At the canning-club demonstrations alone there was an attendance of 372,288. Club leaders visited 204,745 club plats, conducted 1,266 achievement-day programs, held 2,013 leaders' conferences, conducted 4,498 exhibits and 4,532 club fairs and festivals.

A large amount of instructional literature, issued partly by the States and partly by the department, was distributed.

One of the most significant and important steps in boys' and girls' club work during the year was the organization of standard clubs based upon requirements adopted by the club leaders. During 1918, 6,214 standard clubs were organized in 21 States.

During 1918, 527,723 members were enrolled in 21,345 centers, of which 251,032 completed the work, including reports of the season's activities to the State club leaders. The members reporting produced \$6,019,092 worth of products at a cost of \$2,447,313, including payment to the club members of wages for the time expended in the work. Many of the members who did not make their final reports did a considerable amount of work and produced several million dollars' worth of products. The total overhead or supervisory cost was \$547,851, making the supervision cost per member enrolled \$1.05 and per member reporting \$2.18.

The following table gives the number of clubs, the enrollment, the number reporting results, and the results in the more important projects:

Number of clubs organized and total enrollment and results reported in more important projects.

Kind of club.	Clubs organized.	Number enrolled. ¹	Number completing work. ¹	Results reported.
Home-garden.....	6,057	243,406	115,725	2,987,983.76 square rods tended.
Home-canning.....	3,898	78,927	41,823	1,901,789 quarts canned products, 133,067 jars jelly and jam, 40,784 pounds dried products.
Mother-daughter.....	235	5,024	3,498	96,175 quarts canned products, 29,437 jars jelly and jam, 2,125 pounds dried products.
Garment-making.....	2,356	38,239	18,951	198,822 garments made.
Poultry.....	2,171	37,723	16,128	331,072 chicks hatched, 40,735 hens handled, 133,565 dozen eggs.
Pig.....	2,331	31,476	12,974	25,602 pigs managed, 4,423,081 pounds pork.
Potato.....	1,240	23,316	11,307	3,184 acres tended, 646,503 bushels raised.
Bread.....	1,100	18,583	8,706	193,207 loaves baked.

FARM MANAGEMENT DEMONSTRATIONS.

The primary object of farm management demonstrations is to teach and to induce farmers to adopt more efficient methods of organizing and administering their farm business. The work is directed in the different States by extension specialists known as farm management demonstrators.

In most of the Northern and Western States the operation of the income tax law has greatly stimulated the keeping of farm accounts. The farm management demonstrators have grasped this opportunity to push farm account keeping as rapidly as possible. In the main the work is being developed by the county agents. In States where the income tax law affects very few farmers the work has made steady growth and has been done with small groups. Many of the field men find that the best method is to work with small community groups. In States where the income tax law affects a greater number of farmers the farm management demonstrators have endeavored to reach the farmers through larger meetings or through the county agents. There is evidence that interest in the work is rapidly increasing and many more farmers are being assisted each year in summarizing their records both by the county agents and by the farm management demonstrators. During the year ended June 30, 1919, farm management demonstrations were conducted in 24 States by 28 demonstrators.

EXTENSION SPECIALISTS.

Extension specialists representing the various bureaus of the department, working in cooperation with this office, continued to study the extension methods practiced in the States and aided in

extending the use of those having special merit. They also carried to the State extension specialists the best results of the research work of the department and endeavored to aid the latter in correlating subject matter and in working out with the county agents a more efficient means of reaching farm people with the desired information and in turn finding out the farm problems which should be brought to the attention of the research bureaus of the department of the State experiment stations.

Specialists of the following bureaus, offices, and divisions of the department cooperated during the year with the extension forces in the States:

The Forest Service made an application of approved forestry principles in the selecting of trees for cutting during the early part of the year while the wood fuel campaign was on and while the War Department was seeking gunstock and airplane timber.

Bureau of Animal Industry specialists encouraged the introduction of sheep into a few central States and on cut-over pine lands of the Upper Lake region, and the reestablishing of the sheep industry in New York and New England. Attention was given to the production of beef cattle by economical methods in the central western States. Organized campaigns for the culling of poultry to increase the egg supply and reduce the feed bills and better methods of feeding were advocated for the increase of both the egg and meat supply. The Dairy Division through its extension specialist continued the cottage cheese production and consumption campaign of the previous year, and increased its efforts in the organizing of cow-testing associations, bull associations, and dairy manufacture. The specialists in charge of animal disease work were engaged particularly in educational methods for the prevention of hog cholera in many of the hog-producing States. These specialists were working in cooperation with the regulatory men and State extension services in assisting county agents in making demonstrations of control methods.

The specialists of the Bureau of Plant Industry continued the campaign to eradicate the common barberry to prevent rust on wheat and entered more vigorously into that against cereal smuts. This work was conducted by squads of demonstrators on seed treatment and barberry identification. One horticultural extension specialist assisted in the preparation of material for boys' and girls' garden clubs and in making a study of extension methods in conducting pomological extension work in the States. A specialist on vegetable gardening assisted in the preparation of material for boys' and girls' clubs and in making plans for the farmer's home garden. Some assistance was given by this person to the commercial growers and canners of tomatoes, peas, and other vegetables.

The Bureau of Biological Survey employed a specialist who conducted work in the Great Plains and the States farther west on the control of rodent pests in cooperation with the county agents and other State forces.

The Bureau of Entomology employed a specialist to conduct its emergency extension work in the control of insect pests and in the production of honey. Very successful campaigns for the control of crickets were carried on in Oregon and Washington and for the control of grasshoppers and chinch bugs in the Middle West and the

Northwest. State extension specialists were cooperated with, as were also the county agents and the regulatory forces of the State, in developing plans for the control of grasshoppers.

The extension specialist in soils visited most of the States in the northern Mississippi Valley and the New England and Rocky Mountain States in the development of a plan of cooperation with the State specialists to increase the nitrogen and humus supply through the raising of more legumes in the crop rotation. He also made plans for extending the saving of manures and the use of green crops and other crop residues. He continued advocating the increased growth of nitrogenous crops to lessen feed bills and to increase the supply and improve the quality of manure.

The specialist representing the Bureau of Markets gave particular attention to the plans under which the marketing organizations of the States were working and to the formation of marketing routes or organizations.

The Office of Farm Management continued its cooperation with this office. The features emphasized in the work of the year were record keeping, the interpreting of the record, cost accounting, increased production per man, and labor distribution.

OFFICE OF HOME ECONOMICS.

C. F. LANGWORTHY, *Chief.*

The Office of Home Economics, developing the general policy followed in the previous year, adapted its work to the special war-time conditions and needs in question of dietetics and the conservation of materials and labor used in the household.

Special emphasis was placed on the work in experimental cookery, partly because during the first months of the year the need for using somewhat unfamiliar food materials required the development and popularization of methods and recipes adapted to such materials and partly because of the increasing demand for the standardization of cooking processes as a means to the better general utilization of food materials, fuel, and kitchen equipment. Much of this work was done in cooperation with or at the request of other bureaus or offices of the department or of other departments, notably the offices of extension work, the Bureau of Chemistry, the Bureau of Plant Industry, the Bureau of Animal Industry, the Bureau of Markets, and the Food Administration. The equipment of the experimental kitchen was increased to include different types of stoves, refrigerators, and other household conveniences so that varying home conditions could be reproduced and comparative studies made of the practical efficiency of different equipment and methods. The nature and results of the work of the experimental kitchen were in brief as follows:

(1) Studies of yeast breads brought out the detrimental effect of long kneading, particularly in the later stages of dough fermentation; several current recipes for yeast starters were tested.

(2) Studies in fuel conservation with gas range determined the losses caused by the common defects of having burners placed too far beneath the cooking utensil, and of having them too large in proportion to the size of the utensil; the claims of a commercial "gas-saver" were not substantiated; gas consumption in using small separate oven over top burner for baking was compared with that of the range oven.

(3) Household methods of making jellies, and of increasing yield from fruits deficient in pectin and in acid by addition of commercial and homemade pectins or of lemon juice or by use of pressure cooker, were studied and favorably reported upon. A study of yield showed that a pound of good jelly-making fruit should yield a pound or more of jelly.

(4) Studies in pastry making emphasized the fact that to be of good quality an economical paste must have water reduced as well as fat, and that vegetable oil can be used for pastry if care is taken not to use too much fat.

(5) Cake making with various oils and other fats demonstrated that baking at temperatures high enough to produce "lumpy cake" (a common fault) causes an increase of gas consumption of about 50 per cent, which is worse than wasted.

(6) A study was made of methods of canning vegetables, especially spinach, and of the rate of heat penetration in processing.

(7) Investigation of various methods of cooking dried fruits and vegetables revealed the fact that in almost all cases preliminary soaking is unnecessary and sometimes distinctly disadvantageous. Observations were also made upon the varying degrees of rapidity with which successfully-dried vegetables gradually lose their color and flavor upon aging, no spoilage having taken place.

(8) Outlines designed to facilitate standardization of methods in experimental cookery were prepared and distributed for use in colleges offering courses in that subject.

(9) Studies in absorption of fat by batters and doughs fried under varying conditions were carried on with a view to controlling this important source of waste.

Experimental studies on the digestibility of various foods were continued. The materials studied included various kinds of wheat flours; wheat bran in a diet containing no wheat flour; water-ground buckwheat; kafir corn milled in specified ways (showing that grinding increases digestibility); soy bean and peanut press cakes (showing them to be nutritious foods as regards composition and digestibility); certain meats concerning the food value of which little reliable information has been available (horse meat, corned seal hams, rabbit, and kid, all of which were assimilated in much the same degree as comparable meats); miscellaneous animal and vegetable fats; and hydrogenated oils.

Various methods were developed for making technical information along the lines of home economics easily available to extension workers and housekeepers, such as a formula by which the food value of a list of foods can be easily and quickly computed and the proper combinations determined; and a series of colored charts showing in attractive pictorial form the groups of foods necessary in an adequate diet and how they may be chosen and combined to make nutritious, palatable, and economical meals. Plans were also worked out for mimeographed loose-leaf notebook information on home economics subjects for the use of home demonstration agents.

In connection with a dietary survey undertaken in cooperation with the Bureau of Markets, 2,000 dietary records, each covering a period of 7 days, were collected from 1,425 families and 575 institutions representing 46 States, 16 nationalities, many occupations and incomes, and both urban and rural conditions.

From a summary of 500 of these family records it appears that the average cost of food per man per day was 46 cents, with an average return in food value of 3,225 calories, 96 grams protein, 118 grams fat, and 405 grams carbohydrate, figures in fairly close accord with the dietary standards ordinarily used in discussing such problems of general nutrition. A comparison of the foodstuffs purchased by the present 500 families with the amounts of these same foods purchased by 400 families about 20 years ago shows that the amount of meat in the diet has decreased about 8 per cent and grain products

about 11 per cent, while dairy products have increased about 6 per cent, vegetables 4 per cent, and fruits 8 per cent. While, judging by these studies, the average diet seems to be adequate, it seems fair to conclude that individual food habits need to be corrected, because out of 500 family studies one-third were getting less than 88 grams of protein and 3,000 calories of energy, values which are considered the minimum for safety.

A different type of survey undertaken, the results of which were tabulated and interpreted during the year, is the so-called household labor survey, made in 91 farm homes in St. Joseph County, Mich. This survey was intended to secure reliable information regarding problems of household management and labor with their important bearings on social and economic conditions, and also to develop methods for similar surveys elsewhere.

Only one-fifth of the farm women represented in this survey hired help at any time, two-thirds depended upon the help given by members of the family, and one-tenth stated that they had no help. The average length of a farm woman's day in this locality was 13 hours in summer and 10 in winter, including time spent at meals. They estimated that they had one and one-half hours of leisure daily in summer and two and one-half in winter. More than one-fourth of the women took no pleasure trips by automobile or train during the year, the others took trips averaging 55 miles. On only 3 farms did the men have the entire care of the poultry, while 69 per cent of the women cared for it all of the year. In 2 of the 3 areas surveyed 73 per cent of the women helped all or a part of the day with farm work during the busy season. Twenty-four out of 27 reporting depended upon the "butter, poultry, and egg money" to furnish the food purchased, household supplies, and part of the family clothing. Only 6 out of the 69 reporting had a bank account, separate from the husband's, for household expenses.

A significant feature of the work with the respiration calorimeter was that done in cooperation with the Bureau of Markets on the specific heat and after-ripening changes of fruit, with special reference to problems of commercial cold storage, in connection with which important improvements were made in the cooling system of the calorimeter. A special respiration apparatus was also devised and constructed for continuation of the cooperative investigations with the Bureau of Entomology on the wintering of bees.

A member of the staff was detailed to assist the Council of National Defense in its food conservation and general thrift work, and 20 so-called United States Thrift Leaflets intended for wide free distribution were prepared to aid the Treasury Department in its educational campaign in wise spending.

Besides bulletins reporting the work of the office, various circulars, popular articles, and mimeographed matter were issued.

The results of the work of the office were brought to the attention of the public not only through publications, but also by correspondence, conferences, and similar ways. This feature of the work has grown to be one of the most effective means of securing and maintaining direct contact with individual housekeepers, teachers, extension workers, and others, the helpfulness of which was especially demonstrated during the war.

REPORT OF THE CHIEF OF THE BUREAU OF PUBLIC
ROADS.

THOS. H. MACDONALD, *Chief of Bureau.*

Roads were planned and their construction supervised for the Marine Corps at Quantico, Va., and for the Bureau of Ordnance at the Edgewood Arsenal, Gunpowder, Md., and outside of cantonments, usually from the cantonment to a city in the vicinity at the following places: Alexandria, Va., to Camp Humphreys; Alexandria, La., to Camp Beauregard; Little Rock, Ark., to Camp Pike; Columbia, S. C., to Camp Jackson; Spartanburg, S. C., to Camp Wadsworth; Greenville, S. C., to Camp Sevier; Petersburg, Va., to Camp Lee; Anniston, Ala., to Camp McClellan.

Several of the above projects were carried out in cooperation between the Federal Government and the State highway departments under the Federal aid road act of 1916.

THE UNITED STATES HIGHWAYS COUNCIL.

The first regular meeting of the United States Highways Council was held in the office of the Director of the Bureau of Public Roads at 10 a. m. Saturday, June 8, 1918.

From the first meeting, June 8, to the last meeting, December 31, 1918, the full council held 27 meetings and the subcommittee 112 meetings. These meetings were in addition to the excellent and continuous service rendered by Mr. Prevost Hubbard and Mr. M. O. Eldridge as a special subcommittee.

Applications for approval, including those which had been submitted to the Office of Public Roads prior to the establishment of the council, reached a total of 7,307. Many of these applications were considered several times by reason of requests for reconsideration or by reason of requirements by the council of further information, so that the total number of considerations aggregated 9,712. No statement as to the exact number of approvals or disapprovals can be given, as many cases were merely deferred and not disapproved, others were conditionally approved or disapproved, others were reconsidered, and still others were affected by an amendment issued September 26 by the War Industries Board to circular 21 permitting the completion to November 1 of projects substantially under way. Still other projects were pending at the time the council ceased its activities, and in consequence it is impossible to segregate those applications which might be considered as definitely disapproved. A quantitative table dealing with the materials, transportation, and funds involved and showing such proportion as had been definitely approved has been prepared, however, and is submitted as follows:

Item.	Unit.	Requested.	Approved.
Capital issues ¹	Dollars.....	49,538,075	7,334,821

¹ Includes applications acted on by Bureau of Public Roads prior to formal organization of United States Highways Council. Requested \$28,748,034, approved \$3,114,381. The Capital Issues Committee has jurisdiction and the Council served merely as an aid to the committee.

THE FEDERAL AID ROAD ACT.

LEGISLATION.

A careful canvass of all the State highway departments made after the original Federal aid road act of July 11, 1916, had been in effect for more than two years, indicated clearly that there were three limitations which were preventing this law from becoming an effective method of procedure between the Federal Government and the individual States. In its conception this law was founded upon the principle of cooperation for the purpose of stimulating road production and of supporting and aiding the States in their individual efforts, but it was found that practically all of the States were limited in proceeding along the lines of an adequate program: (1) By the post road requirements; (2) by the limitation of Federal participation to \$10,000 per mile; and (3) by the amount of the appropriation carried.

These features of the law were handicapping practically all of the States very seriously. Anyone who is familiar with the rural free-delivery routes as now laid out knows that the mail carrier pursuing his zigzag route does not in many cases follow throughout their length those roads on which traffic is concentrating more and more, and which must therefore receive the first attention from the State road authorities. Improved highways will become one of the greatest possible advantages to the Postal Service, but this will require a rearrangement of routes as the roads are improved. The logical and systematic preparation of the eventual roads suited to rural mail purposes, therefore, requires much flexibility in the law providing Federal aid for road improvement.

The limitation of \$10,000 per mile for Federal participation was reasonable when the law was conceived during 1915 and the early part of 1916, but at the time of the passage of the act the cost of road construction was mounting rapidly, and by the year 1918 the provision under which the Federal Government offered to pay 50 per cent of the cost of the roads and the limitation of \$10,000 per mile could not both be applied in the construction of the higher type roads. The amount of the funds carried by the original appropriation was

thought entirely sufficient to start the Federal aid cooperative program. At the time these sums were fixed, however, it could not be foreseen how enthusiastically the proposal of the Federal Government would be received by the public generally. The States were embarrassed by applications for Federal aid which the original allotments could not supply, and by the appropriation of sums so much greater than the amount necessary to meet the Federal aid appropriation that the whole plan in the fall of 1918 was in a most disappointing status. All of these objections were met in an entirely acceptable manner by the amendments to the original act carried in the Post Office appropriation act of February 28, 1919 (H. R. 13308). The definition of the term "rural post road" was so broadened as to permit the improvement of roads which could not qualify under the original definition. The maximum amount which can be paid by the Federal Government was increased to \$20,000 per mile, exclusive of the cost of bridges of more than 20 feet clear span. The increase in the share of the costs which may be paid by the Federal Government meets fairly well the demands of the several States in that respect. At the suggestion of the Secretary the original appropriation of \$75,000,000 for Federal aid roads available for the five-year period, 1916-1921, was increased by \$200,000,000, of which \$50,000,000 was available at once, \$75,000,000 on July 1, 1919, and \$75,000,000 on July 1, 1920.

NEW REGULATIONS.

The Rules and Regulations for the administration of the Federal aid road act as authorized by section 10 were originally issued by the Secretary on September 1, 1916. While these were drawn after a conference with the State highway officials, in which more or less conflicting views were expressed, it required the light of actual experience to disclose the principal difficulties which existed and which prevented the fullest cooperation with the States. After more than two years' experience a canvass of the States indicated that the principal causes for disagreements or delays in the original Rules and Regulations could be summarized under the following points:

1. Conflicts with the State laws or State constitutions.
2. The limitations as to the expenditure of Federal aid funds for certain costs entering into completed roads.
3. The details of the plans, specifications, and survey requirements.
4. Adherence to standard specifications in specific instances in which economy prompted modifications.
5. Difficulties or delays encountered from inception of projects to final completion, in many cases resulting partially from overcentralization and lack of authority vested in the district engineers or the local representatives of the bureau.

Practically all of the complaints or misunderstandings voiced by the States were subject to classification under one of these causes, and it will be apparent that these difficulties were greatly accentuated by the new and untried State legislation enacted in every State and by the new and enlarged organizations required on the part of the States and the Federal bureau itself.

During the last fiscal year several minor amendments were made. At the December, 1918, meeting of the State highway officials the subject was thoroughly discussed and a general revision of the rules and regulations at once undertaken. These were completed after the amendment to the Federal-aid road act of February, and on March 12, 1919, the rules and regulations were issued. As revised, these

rules and regulations have been generally accepted as satisfactory by the State highway departments.

These rules and regulations, however, must be regarded only as an instrument to facilitate road production under laws in force, whether State or Federal, relating to the Federal-aid road work. Several modifications of present procedure are now in contemplation for the purpose of facilitating and expediting action, and whenever it becomes apparent that revisions can be made which will result in economy of either time or effort, in so far as such modifications are legally possible, recommendations will be made for further revision to the secretary forthwith.

RESPONSE OF STATES TO THE FEDERAL AID ACT.

The Federal aid act inaugurated a plan of road improvement that has met with a remarkable response on the part of the public. Very few of the States were in a position to act until the winter of 1917, because of the need of new legislation and the appropriation of funds to meet the Federal-aid allotments. In April of that year war was declared, with its attendant concentration of effort to the one object. Highway construction throughout the country was necessarily and unavoidably restricted and confined to the more vitally necessary projects during this period. It was not until after the signing of the armistice in November, 1918, that plans were formulated for the resumption of the work which had been brought almost to a stop. But during that period the attitude of the public underwent a great change. The experiences during the war had crystallized public sentiment in favor of an improved system of highways to supplement the transportation facilities afforded by the railroads of the country and to replace the roads which had suffered to such a material extent by the unforeseen traffic which had been forced upon them. The necessity for extensive road improvement was impressed more forcibly upon the public mind by reason of the demonstrated inadequacy of the system of railroad transportation and by the difficulties experienced when, in an endeavor to relieve the railroads, an attempt was made to utilize in a large way the highways in some sections of the country.

That the public is generally supporting a greatly enlarged program of highway construction is evidenced by the fact that up to July 1, 1919, bond issues aggregating \$224,800,000 had been authorized and approved by vote of the people. Provision has also been made in other States for submitting to a vote during the calendar year additional State highway bond issues amounting to more than \$314,000,000. Only one State road bond issue voted on during the year was rejected. In addition to the sums which become available through the sale of bonds, other State road funds have been provided from legislative appropriations, various State road tax levies, and the proceeds of motor vehicle license fees. In addition to these generous State road funds, counties and improvement districts are providing largely through bond issues for very large amounts. From all sources there are in sight funds amounting to considerably over \$1,000,000,000 for highway construction, which will be made available more rapidly than such sums can be expended efficiently and economically. The test of the State highway departments and of the Federal bureau will come in so administering the expenditure of these sums that the con-

fidence of the public will be justified. It is very apparent that the whole highway program has passed beyond the propaganda stage, and that there is now the greatest possible need for the highway organizations to approach the task of actual road building in a responsible, sane spirit that will result in the production of roads rapidly but without extravagance and without loss of faith on the part of the taxpayers.

STATUS OF FEDERAL AID ROAD WORK.

Of the post road appropriations made by the Congress there was available during the fiscal year a total of \$80,000,000, the same being the sum of the appropriations for the fiscal years 1917, 1918, and 1919. From this there was deducted the 3 per cent allowed by law for the administrative purposes and the remainder, or \$77,600,000, was apportioned among the several States. Of this sum there was paid to the States during the fiscal year for road construction work a total of \$2,702,247. At the close of the fiscal year 1918 there had been paid to the States \$125,445. So that the grand total of all payments to the States on June 30, 1919, was \$3,127,693, which left to the credit of the States an unexpended balance of \$74,472,306. In addition, the \$95,000,000 appropriated for the fiscal year 1920 was apportioned to the States, after deducting the 3 per cent for administrative purposes, and that sum became available with the close of the fiscal year. On July 1, 1919, therefore, there was available to the credit of the States for expenditure a total of \$166,622,306.

During the fiscal year this department approved project statements submitted by the States for 736 road projects, involving the improvement of 6,470 miles of road at an estimated cost of \$91,495,797, and on which \$38,664,397 Federal aid was requested. Up to June 30, 1918, 580 project statements had been approved for 6,249.40 miles of road, estimated to cost \$42,278,770, and on which was requested \$16,049,821 Federal aid. So that on June 30, 1919, there had been approved by this department project statements for a total of 1,316 projects, involving 12,719.98 miles of road estimated to cost \$133,774,568, of which \$54,714,219 in Federal aid was requested. At the close of the fiscal year, therefore, there remained to the credit of the States an unallotted balance, including the additional funds which then became available, of \$111,908,087.

Agreements with State highway departments were executed during the fiscal year to cover 453 of the projects for which project statements had been approved. The estimated cost of the projects covered by these agreements amounted to \$41,598,209, of which amount there was set aside in the Treasury \$18,031,680 as Federal aid. At the close of the fiscal year 1918 there had been executed a total of 224 such agreements of an approved estimate of cost of \$14,820,633, of which there was set aside in the Treasury \$5,899,936. Thus, at the close of the fiscal year 1919 a total of 677 agreements to cover projects had been executed, involving a total approved estimate of cost of \$56,418,843, and a total of \$23,931,617 Federal aid. The projects for which agreements had been executed at the close of the fiscal year call for the improvement of a total of 5,791.23 miles of road.

Under the terms of the Federal aid road act the apportionments to the States for each fiscal year remain available for expenditure until the close of the succeeding fiscal year, but it is construed that

funds covered by agreements are expended within the meaning of the law. Each State had a sufficient amount of funds under agreement at the close of the fiscal year to prevent its losing any part of the funds apportioned to it.

Statistical information is shown in the following tables as to the status of Federal aid projects, the miles and types of roads included in Federal aid projects, and the expenditure and construction of roads during the fiscal year:

Summary of miles and types of roads included in Federal aid projects executed during fiscal years 1917, 1918, and 1919.

Type.	Mileage approved.	Per cent of total.	Total cost.
Earth.....	1,622.520	28.02	\$6,615,214.86
Sand-clay.....	626.705	10.83	2,657,970.03

¹ A number of projects closed down for the winter.

Summary of project statements approved and project agreements executed.

Year.	Project statements approved.			Project agreements executed.		
	Number of projects.	Estimated cost.	Federal aid requested.	Number of projects.	Estimated cost.	Federal aid.
Reported for fiscal year 1917....	23	\$1,845,433.60	\$846,151.84	6	\$547,092.25	\$224,717.20
Reported for fiscal year 1918....	557	41,053,200.67	15,478,089.66	218	14,239,939.15	5,658,458.42
Now reported for fiscal year 1919.....	736	91,495,797.99	38,664,397.41	454	41,631,731.67	18,048,441.97

NOTE.—The figures here given for the fiscal years 1917 and 1918 are from the annual reports for those years. As projects are modified from time to time, a project occasionally withdrawn, etc., sums drawn from the figures here given will not agree with the figures shown in the larger table, which figures have, in all cases, been corrected to June 30, 1919.

NATIONAL FOREST ROADS.

During the first half of the fiscal year unfavorable conditions for road improvement, resulting from the war, limited the period during which active operations have been resumed to a few months of the present construction season. The major portion of the work for this fiscal year has been in the last four months. There has been in these few months a marked increase in road activities in the national forests, even though conditions have not returned to the normal pre-war basis.

The year has been marked with a shortage of labor, equipment, and material for construction purposes. Unsettled conditions generally have made contractors extremely cautious, and it has often been difficult to recommend to you awards for work at what was considered satisfactory prices. On a number of occasions we have felt it advisable to recommend against making awards even after work had been extensively advertised and previous proposals rejected. In these instances department forces have been organized to start the work and other portions of the projects have been let out to station contractors. A great handicap to the work has been the lack of suitable equipment in the possession of local contractors who are making proposals on road construction. The assembling at points convenient to our operations of suitable construction equipment which can be loaned to contractors for our work will aid materially in securing more reasonable prices and hasten the completion of our building program.

It is hoped that from the surplus equipment of the War Department allotted to this bureau under the terms of section 7 of the Post Office appropriation act it will be possible to provide for the major equipment needs of this bureau. Requisition has been placed and shipping orders given for approximately \$2,000,000 worth of equipment and material. Very little has been received in time for this season's work. It is important that it be secured in ample time for proper assembling, overhauling, and distribution before the next construction season opens, so that the purchase of other equipment may be obviated.

With respect to explosives the bureau has been materially benefited in having allotted to it about 4,000,000 pounds of T. N. T. from the War and Interior Departments. Considerable of this material has been delivered and some has been used on our work during the present season.

The general organization plan followed during the preceding fiscal year has been continued, there being six distinct offices and suboffices to cooperate with the six western forest districts, the work in the seventh forest district being divided among the district engineers of this bureau in charge of post road work. There has been an increase in the personnel on forest-road work made necessary by our increased building program.

DISTRIBUTION OF SURPLUS WAR EQUIPMENT, SUPPLIES, AND MATERIALS.

As a further stimulus to road-building activities and to facilitate the resumption of such work by the several State highway departments, Congress also incorporated in the Post Office appropriation

act of February 28, 1919, a provision authorizing the Secretary of War to turn over to the Secretary of Agriculture for distribution to the States available war material, equipment, and supplies suitable for use in the improvement of highways and not needed for the purposes of the War Department, to be used on roads constructed in whole or in part by Federal aid, the Secretary of Agriculture being authorized to retain from such distribution not to exceed 10 per cent of such material, equipment, and supplies for use in the construction of national forest roads or other roads constructed under his direct supervision. Such materials were required to be distributed to the States on the same basis as provided by the Federal aid road act for the apportionment of the Federal aid appropriations. Immediately on receipt from the War Department of lists of materials, equipment, and supplies declared to be surplus, a canvass was made to ascertain the requirements of the several States, and allotments were made with a view to meeting these requirements. There had been allotted to the States 20,519 motor trucks and quite a number of miscellaneous articles of equipment suitable for road-building purposes. There was in the hands of the War Department in the United States and in France quite a large amount of additional surplus equipment suitable for use in road-construction work, and the War Department signified that much of this would be turned over to this department.

At the close of the fiscal year about one-third of the number of motor vehicles allotted were actually in possession of the States, and only a very small list of other equipment, supplies, or materials were actually delivered. The total number of motor vehicles and amounts of other equipment and supplies that will eventually be made available for use by the States can not be stated. This distribution of trucks, although not proceeding as rapidly as had been hoped, has assisted many of the States greatly in resuming their road programs. This bureau has acted only as an agent of distribution between the War Department and the various State highway departments, but it is believed that the policy of making available surplus materials and equipment which could be directly used for road-building purposes is one from which the public generally is likely to receive a far greater benefit than if such supplies were disposed of through sales to private concerns. The faith in such a policy has resulted in a vigorous and persistent effort to secure for the States as large an amount of the equipment and supplies as can be put into useful service within a reasonable length of time. This policy has extended to the dispatching of a special representative to France to receive consignments of such material available in France for return to this country.

ROAD BUILDING AND MAINTENANCE INVESTIGATION.

An object-lesson road was built of sand-clay construction in Pierce County, Ga.

Reports on county road systems were made by Butte, Colusa, Santa Cruz, Solano, Sonoma, Sutter, and Yolo Counties, Calif. Advice was given regarding special road problems in Massachusetts, North Carolina, South Carolina, and Virginia. Engineers were furnished to plan and superintend the construction of the Alexandria-Camp Humphreys road in Virginia.

ROAD MANAGEMENT AND ECONOMICS.

The economic highway survey inaugurated toward the end of the fiscal year ended June 30, 1917, has been continued, but on a lesser scale than during the fiscal year 1918. This condition was brought about by the participation of this bureau to a large extent in activities connected with war work, and later to the added stimulus given road construction by the increased appropriations made by Congress for Federal aid work. The office work of completing the final maps of the area surveyed has been in progress during the year. The complete maps and text give detailed information on the roads, bridges, and economic conditions in the territory covered by the surveys. This work has proved of considerable value, as it brings together in a workable manner a vast amount of detailed highway information. The work has not only been of value to the State highway departments and this bureau, but is proving of value to other branches of the Government.

A large amount of data has been compiled relative to the tonnage of the products of the field, forest, and mine for the various counties in the United States. This information finally tabulated will be of considerable value in connection with the future planning of main-line highways, and will also govern to a considerable extent the types of pavement to be constructed on these highways.

ECONOMIC STUDIES OF HIGHWAY SYSTEMS.

The study carried out during the preceding year of the classification of highways and of the procedure followed in their construction and maintenance has been completed, and the final results have been published in serial form in *Public Roads Magazine* under the caption, "State Highway Management, Control, and Procedure." These articles are found in the issues, July, 1918, to February, 1919, inclusive.

FARM IRRIGATION INVESTIGATIONS.

Conclusion of the war terminated the many special investigations which had been made in behalf of the Capital Issues Committee regarding the feasibility and desirability of irrigation and drainage enterprises in course of promotion. Demands for this work were promptly succeeded, however, by calls for advice and technical assistance from many irrigation and drainage districts, organized or prospective, whose plans, held in abeyance during the war, sought immediate execution at its close. Irrigation enterprises of this class, including in all many hundreds of thousands of acres, comprised besides new projects several of long and fairly prosperous history. High values of farm produce gave much encouragement to such enterprises to improve their structure, revise their organizations, and conserve their water supplies, to the end that a more economical distribution of water might be effected and the area served in the past materially extended. Thus, in Idaho alone, projects are now in various stages of promotion which, if carried out as now planned, will increase the irrigated area of the State by 1,500,000 acres; half as much as is now irrigated.

Notwithstanding the rapid development of this work, standard investigations of duty of water, pumping, flow of water in various types of conduits, and efficiency of appliances and equipment used in irrigation, which had either been temporarily discontinued or reduced in scope during the war, were resumed. Technical reports on flow of water in concrete pipes and spillways for reservoirs and canals were completed and await publication. An extensive field examination to determine the efficiency of typical reservoirs in Cache la Poudre Valley, Colo., begun in 1917, was brought to a conclusion. Meanwhile the investigation of flow of water was extended to metal pipes, a survey of effective types of chutes, drops, and other canal structures, begun prior to the war, was resumed, and a final report was prepared on three-years' experiments to determine the proper time and amount of irrigations in the vicinity of Twin Falls, Idaho. Laboratory experiments, which sought to ascertain the movement of moisture from a free-water surface in various soils, were finished and the results assembled in a report which awaits publication. Studies of the capillary movement of moisture between soils of different moisture content were resumed. These investigations are being supplemented by similar studies in irrigated fields, lands provided with artificial drainage, and soils which should be drained.

High cost of iron and steel has greatly widened the field and enlarged the demand for concrete pipe to meet rigid conditions in irrigation systems, notably where pressure pipe is needed for the conveyance of water under high heads. California alone now has more than 150 concrete pipe manufacturers, and concrete pipe is being installed at the rate of many hundred miles a year. A need for the standardization of methods of manufacture and the development of standard tests and testing equipment to determine the strengths of pipes of different makes has resulted in the establishment of a field laboratory where such equipment will be devised and tests conducted. Field tests, meanwhile, have been made to determine the tensile strength, resistance to internal pressure, and perviousness of 40 kinds of concrete pipe now in use in irrigation.

Other work demanded by after-war conditions has included a study of new devices to reduce labor in the distribution and application of water, initiation of experiments to determine the extent of seepage losses from canals, and the extending of first-hand assistance to communities seeking the development of underground water for irrigation. High prices and curtailment of sales of pumping machinery during the war resulted in a material lessening of interest in pumping, but conditions of severe drought and a lifting of war restrictions immediately restored pumping to a position of prime importance in the irrigation field.

DRAINAGE INVESTIGATIONS.

Until the close of the calendar year war conditions continued largely to control the operations of the division. In addition to the fact that approximately 50 per cent of the force was in the military service, the immediate requirements of the situation diverted the attention of agricultural landowners temporarily from contemplated drainage work. Early in 1919, when the improvement of

their land once more claimed their attention, the landowners were at once confronted by the prevailing high costs of labor and materials. Nevertheless a decided tendency has been shown to proceed with important drainage projects in spite of high costs. This tendency has been so marked that by the close of the fiscal year the activities of the drainage division were limited only by the funds available.

Operations, though curtailed, were carried along the same lines as in former years. More attention, however, was given to small projects such as those of farm drainage that would bring quick results, and less to the larger undertakings. Certain technical investigations which had been started in former years and which required continuous records to yield their greatest value were continued.

Cooperative working agreements with the States of Alabama, Arkansas, Georgia, North Carolina, and Tennessee were continued.

During the year 126 separate surveys, in 13 States, were made, and drainage plans prepared for farms where the owner desired either to install tile or construct terraces. In many other cases field examinations were made and advice given informally. The manuscript for a bulletin on farm drainage, to be published by the West Virginia College of Agriculture, was prepared, as was also one for publication by the Alabama Agricultural Experiment Station.

A report on drainage conditions in Michigan was prepared after a full investigation of all aspects of the situation in that State. This report was prepared in cooperation with, and published by, the Michigan Geological and Biological Survey. Studies of the cost of operation of drainage pumping plants in southern Louisiana were continued. The study of the matter of drainage assessments was resumed after having been suspended during the war.

A comprehensive study of the drainage problem presented by the Red River of the North has been undertaken. This work consisted mainly in the correlation of existing data, and has for its ultimate object the correction of the overflow and permanently wet conditions of extensive tracts of land along the river in Minnesota, North Dakota, and South Dakota. Twenty-seven preliminary examinations were made of overflowing streams and swamp areas in various States and reports submitted to landowners.

Studies of underground water and the subsidence of muck soils after draining were made in Florida. Investigations of methods of draining muck and peat soils were carried on in the State of New York.

The records of rainfall and run-off which have been kept continuously since 1910 in the prairie section of Louisiana have been continued. These records are of great value, as they determine the percentage of the rainfall that must be removed, and therefore establish the required capacity of drainage plants. The manuscript was prepared for a bulletin which will summarize the experiments made by this division for determining the roughness coefficient in Kutter's formula. These experiments were made in dredged ditches in Mississippi, Tennessee, Iowa, North Carolina, and Florida. The manuscript for a bulletin giving the results of an extensive study of the flow of water in tile drains has also been completed.

In accordance with an agreement with the Florida Agricultural Experiment Station, cooperative experiments were conducted on the farm of the experiment station at Gainesville, for the purpose of determining the value of sewage irrigation for that type of soil. Experiments were conducted at Vineland, N. J., with several new types of spray nozzles and automatic irrigation sewage valves. Numerous plans for small irrigation plants in the humid section have been prepared and much assistance of an advisory nature rendered.

Twelve investigations and reports were made during the first half of the year, to the Capital Issues Committee, respecting projects for which bond issues were proposed.

RURAL ENGINEERING.

FARM DOMESTIC WATER SUPPLY AND SEWAGE DISPOSAL.

Seven field examinations were made of farm water systems, and advice was given for improving them.

Five rural septic tank installations were designed or the main features outlined.

Work was begun on the preparation of manuscript and illustrations for a bulletin on "Simple Sanitary Conveniences for Farm and Tenant Houses."

Estimate of cost and specifications were prepared for a gravity water system for a large farm establishment in Georgia.

Data was compiled relative to garbage disposal and reduction, plumbing systems, and sewer and pool cleaning machines.

FARM STRUCTURES.

There were prepared for general distribution working drawings, and, in most instances, bills of materials for the following farm structures: A granary, two rural schoolhouses, four farmhouses, three bunk houses, two milk houses, standard cow manger, dairy barn, poultry house, manure pit, roof and storm cellar, movable hog house, self-feeder for hogs, bull barn, breeding rack for cattle, and a small garage.

Plans were prepared for the plumbing and heating layout for the proposed laboratory building at Arlington for the Bureau of Public Roads.

For other bureaus of the department drawings for the following were prepared: Milk station, cheese factory and creamery for the Bureau of Animal Industry, a garage and shed, a greenhouse, and a foreman's residence for the Bureau of Plant Industry at Sacaton, Ariz. This latter was designed particularly to meet conditions prevailing in the arid sections, and it undoubtedly will prove of assistance to ranchers and others in future building operations in Arizona and other arid sections.

An inspection was made of the offices of the Bureau of Crop Estimates, and inspection and advice given relative to the design and construction of a large manure pit at the United States Soldiers' Home. The construction of the Color Investigations Laboratory at Arlington was supervised for the Bureau of Chemistry.

The preparation of the manuscript for a bulletin on the Farm Shop and Equipment was begun.

A number of designs were prepared for use in a bulletin on cattle feeding to be published in cooperation with the Division of Animal Husbandry.

An illustrated yearbook article, "Housing the Worker on the Farm," was prepared and published as a separate.

A number of informal talks were given before demonstration agents in the South on rural housing.

The architect of the division was detailed from August 1, 1918, to April 1, 1919, to the Building Materials Division of the United States War Industries Board to assist in the preparation of standard specifications and details for building construction.

MECHANICAL PROBLEMS.

The dust-spraying apparatus for dusting cotton plants for boll weevil, designed during the previous year, was further developed in cooperation with the Bureau of Entomology.

For the purpose of obtaining data a number of private hydro-electric installations were inspected.

Drawings for several pieces of chemical apparatus were prepared for the Bureau of Chemistry, including an air-cooled gas reaction apparatus, laboratory gas reaction apparatus, metal baths, a phthalic anhydride plant, condensers, automatic valve control.

A yearbook article on "Electricity and power from small streams" was prepared and published as a separate.

Manuscripts and numerous drawings for illustrations for bulletins on "Farm House Heating Plants," "Farm House Lighting," and "Farm Hydro-Electric Plants" were started but the work was not completed.

Farmers' Bulletin No. 991, which is number five of the series "Care and Repair of Farm Implements," was prepared and published.

The chief of the division, assigned to the Secretary's committee on farm equipment control, did considerable work in this connection during the year. Upon the resignation in the spring of 1919 of the official in charge, all of that work was turned over to the Division of Rural Engineering and has been handled without any addition to funds or personnel of the division.

During the season of 1918 the United States Food Administration conducted a campaign looking to the conservation of grain through improved methods of grain thrashing. Upon the termination of the Food Administration's activities the grain saving work was taken over by the Division of Rural Engineering in cooperation with the States Relations Service. In furtherance of the conservation work "thrasher schools" were held in various parts of the grain growing sections of the country. Engineers of the division outlined the courses for and attended these schools, giving talks and demonstrations to farmers and thrasher men on thrasher operating. Though the work was begun late in the spring the results were gratifying as it was shown that more good can be accomplished by instruction prior to the opening of the thrasher season than by an attempt at supervision of operations during thrashing.

MISCELLANEOUS.

In connection with replies to requests for assistance on rural engineering problems there were prepared sketches, data, and short articles on a variety of subjects. In the solution of specific problems there were prepared sketch drawings of alterations and additions to

farmhouses, details of a concrete floor slab, sketch showing how to cut rafters, a four-horse eveners, a concrete seed and potato warehouse, farmhouse heating layouts, farmhouse lighting layouts, a hydropneumatic system for hard and soft water, farmstead layouts.

To the information series used in connection with the correspondence there was added information relating to the following subjects: Fireplace construction, farmstead planning, dairies, plaster and plastering, building materials (manufacturers and dealers).

Problems and correspondence relating to the following subjects have been handled:

Farm structures,
Wall plasters and kalsonines,
Ice house design and construction,
Farm water supply,
Farm sewage disposal,
Farm hydroelectric plants,
Farm lighting systems,
Painting,
Stump pullers,
Farm heating systems,
Windmill electric plants,
Grinding mills,
Thrasher boiler inspection,
Concrete construction,
Cooling systems,

Stream surveys and developments,
Farm ice houses,
Farmstead planning,
Chemical closets,
Farm implements,
Tractors and gas engines,
Protection against lightning,
Fencing,
Stone work,
Insulation,
Damp cellars,
Cement stucco,
Lumber,
Motors, and
Disinfectants.

Exhibits representing the work of the division were prepared for use on county fair circuits; one was also sent to France. Plans for farm structures were sent to France with a view to their use in connection with the reconstruction of the devastated sections of that country and for the instruction of members of the American Expeditionary Forces who are expecting to follow farming when they return to the United States.

TRACTION TESTS.

Calculation of results of traction tests made in the last few years were discontinued in December owing to the induction into military service of the man handling that work.

Under section 9 of "An act making appropriation for the service of the Post Office Department for the fiscal year ending June 30, 1920, and for other purposes," the Secretary of Agriculture is required, through the War Department, to ascertain the number of days any soldier, sailor, or marine has worked on public roads in the several States (other than roads within the limits of cantonments or military reservations in the several States) during the war, the location of the work, and the names and rank of the men so employed. It is further authorized that any officer or enlisted man who has so worked shall have his pay equalized to conform to the compensation paid to civilian employees in the same or like employment, and the amount found to be due shall be paid from the 1920 appropriation allotted in section 8 of the same act to the States wherein the construction or repair work was performed.

As all work done as described in section 9, above referred to, was under the supervision of the War Department, and as the necessary fiscal arrangements require the certification of some supervisory official cognizant with the work, it was found desirable, to expedite the preparation of the necessary pay vouchers, to ask the Secretary of War to detail a representative of that department who should have

cognizance of the work to act as such certifying officer. In response to this request the Secretary of War detailed a representative to act conjointly with a representative assigned from the Bureau of Public Roads of the Department of Agriculture, and the assembling of the required records and claims and the preparation of the necessary vouchers are now in progress.

ROAD MATERIAL TESTS AND RESEARCH.

During the first six months of the last fiscal year research work was continued as during the previous year in a much curtailed form. Inability to obtain men to replace those entering the Army, cooperation with other branches of the Government in war activities, and supervision of specifications and the materials used in Federal-aid road construction account for this lull in investigation work.

Up to November assistance was given the Fuel Administration in its work for the United States Highways Council. This consisted in making recommendations relative to granting permits for securing bituminous materials for road construction and maintenance. In November a plan of research was outlined in order to continue this class of work with renewed vigor, and from November to the end of the fiscal year this phase of laboratory activities has been greatly increased with a corresponding increase in personnel.

ROUTINE CHEMICAL TESTING AND INSPECTION.

Two hundred and sixty-three samples were examined in the chemical laboratory. This represents a decrease of 9 per cent as compared with the preceding fiscal year. Of the samples examined, 206 were bituminous materials, 46 metal, and 11 sand, rock, and Portland cement.

PHYSICAL TESTS OF ROAD BUILDING MATERIAL.

In the physical laboratory, 1,804 samples were tested. This is an increase of 7 per cent as compared with the preceding fiscal year, and is well above the average of routine work. The samples may be classified as follows: Rock, 262; concrete, 252; sand, 205; gravel, 151; slag, 54; cement, 49; miscellaneous, 111. Samples were received from 41 States, and also from Canada.

MICROSCOPIC EXAMINATION AND CLASSIFICATION OF ROAD-BUILDING ROCK.

The Petrographic Laboratory examined 686 samples of road-building material during the year, an increase of almost 9 per cent over the preceding year and well above the average of routine work. Of these samples, 249 were rock, 41 slag, 151 gravel, 189 sand, 45 clay, and 11 miscellaneous.

Of the samples examined in the physical, chemical, and petrographic laboratories, 355 were materials for use in Federal-aid construction.

RESEARCH ON DUST PREVENTIVES AND ROAD BINDERS.

The following investigations have been under way on bituminous materials:

1. Comparison of old and new volatilization tests in gas and electric ovens.
2. Exposure tests on bituminous materials of known chemical composition.
3. Study of the distillation of California and Mexican petroleum with reference to the manufacture of road oils.

4. Bituminous joint fillers.
5. Chemical composition of asphalts and tars.
6. Methods of making float tests.
7. Investigation of the action of copper salts on bituminous materials.
8. Investigation of the toughness of bituminous aggregates.

One investigation on the thickness of bituminous films on different types of aggregates has been completed and the data is ready to be worked up in form for publication. A study of the asphalt content of oils has also been completed and is ready to be put in shape for publication. A paper is now being published on the microscopic examination of bituminous materials. A paper on the Efficiency of Bituminous Surfaces and Bituminous Pavements under Heavy Motor Truck Traffic was presented before the American Road Builders' Association.

EXPERIMENTAL BITUMINOUS ROAD CONSTRUCTION AND MAINTENANCE.

As during the previous year, supervision and inspection of experimental bituminous roads has been confined largely to the vicinity of Washington. One inspection was made, however, of the road between Boston, Mass., and Portland, Me., and between Portland and Bowdoinham, Mass.

NONBITUMINOUS ROAD MATERIAL INVESTIGATIONS.

The quarry investigations begun during the previous year to study industrial practice in the preparation of commercial broken stone aggregates with a view to standardization of sizes and to obtain cost data, etc., was continued and an extensive study was made of the quarries in the South and in eastern Massachusetts and of two quarries near Poughkeepsie, N. Y. Altogether 64 inspections were made of crushed stone producing plants. Papers written as a result of these investigations appeared in the September, 1918, and the June, 1918, issues of Public Roads.

A large number of brick roads were inspected throughout Ohio, Indiana, Illinois, Iowa, Nebraska, and Missouri, in order to make a detailed study of failures in this type of road, and a report on these inspections was published in the February, 1919, issue of Public Roads. A large number of slag-concrete roads were also inspected in the vicinity of Youngstown, Ohio, and a report was prepared on this inspection.

STANDARDIZATION OF METHODS OF TESTING BITUMINOUS ROAD MATERIALS.

Cooperation with the American Society for Testing Materials was continued through the Committee on Bituminous and Nonbituminous Road Materials. The following investigations will be of direct benefit in the standardization work of committee D-4:

- Asphalt content of oils.
- Comparison of volatilization tests.
- Chemical composition of asphalts and tars.
- Methods of making float tests.

STANDARDIZATION OF METHODS OF TESTING NONBITUMINOUS ROAD MATERIALS.

Tests were continued on a revised standard abrasion test of rock and a study is being made of an abrasion test for gravel. Steps were

also taken during the year to study a new abrasion test for concrete. A new abrasion test for stone block is also being standardized and the results are available for the standardization work of the road materials committee of the American Society for Testing Materials.

CONCRETE INVESTIGATIONS.

A large number of tests were made for the concrete-ship department of the United States Shipping Board on the bond strength of steel reinforcing bars coated with protective coatings. Tests were also made of the pressure exerted by concrete against forms when the concrete was poured at different rates. An elaborate series of tests has been planned on an investigation of blast-furnace slag for use in road and bridge construction, and a large number of samples of slag have been collected from all of the principal slag producing plants in the country. A new instrument has been designed and built in the division for measuring the wear of concrete roads under traffic. This instrument will be described in a coming report in Public Roads. Wear measurements were made on the Camp A. A. Humphreys concrete road with this instrument.

The work of testing concrete slabs was temporarily discontinued during the year but will be resumed as soon as possible. A paper based on past tests appeared in the September, 1918, issue of Public Roads. An investigation on the "Bonding of new cement mortar and concrete to old" was completed, and a paper on this subject was published in Public Roads of June, 1919.

ROAD AND BRIDGE FOUNDATION TESTS.

The field tests conducted upon earth fills in the vicinity of Washington were continued, an effort being made to determine accurately the pressures exerted by earth fills against retaining walls. Tests were also continued on the distribution of pressures through earth fills. Specimens have been prepared for conducting impact tests on road slabs. The slabs are laid directly on the subgrade and will be tested under the impact of a machine designed to give the same effect as the rear wheel of a heavy motor truck. A large number of tests have also been made to measure the impact exerted by trucks on roads and a preliminary paper has been prepared. Specimens and apparatus have also been built for a new series of tests on the wear-resisting qualities of paving sections. These sections are laid in narrow strips to a total length of 400 feet and will be subjected to rapid wear by means of a special truck designed to travel continuously back and forth over a narrow portion of the test section. Preliminary tests have also been started on the bearing power of soils with particular reference to the subgrades of roads. A field test was made on the Camp Humphreys concrete road in order to determine the distribution of concentrated loads through the road to the subgrade. A paper on this test appeared in the April issue of Public Roads. The above tests were outlined to throw light upon the theoretical design of higher types of roads.

FEDERAL-AID MATERIALS TESTS.

During the year 2,491 test reports submitted by laboratories throughout the country on samples of material used in Federal-aid

road construction were examined and comments prepared regarding them. In addition, 92 specifications proposed for use in Federal-aid construction were examined and recommendations were made regarding those parts of the specifications dealing with materials.

INSTRUMENT MAKING AND REPAIRING.

Since March 5 the machine shop has been included under the direction of the Division of Tests, and during that period 28 jobs have been completed.

REPORT OF THE CHIEF OF THE BUREAU OF MARKETS.

GEORGE LIVINGSTON, *Acting Chief of Bureau.*

During the fiscal year 1919 the work of the Bureau of Markets was directed by Mr. Charles J. Brand, who resigned June 30, 1919, to accept a commercial position.

The appropriations available were largely augmented by emergency funds, which were deemed to be necessary at the time the appropriation bills were passed in the fall of 1918. The unexpected signing of the armistice changed the aspect of the work materially, however, and it was necessary by the middle of the year to take steps to anticipate the discontinuance of emergency appropriations at the end of June and to prepare to place the Bureau on a normal basis at the beginning of the new fiscal year with as little confusion and detriment to the work as possible. The various market news services of the Bureau had been much expanded with emergency funds and this forced contraction of work made it necessary either to discontinue certain leased-wire circuits during the latter part of the fiscal year or to serve notice that such discontinuance would have to be effected in the summer or fall. Vigorous protests against this action were received, especially from the western part of the country, which was to suffer the greatest loss in service.

These reductions in appropriations caused the elimination of much work which would have an important bearing on present problems in connection with the distribution of food products. Therefore, Congress has recently been requested to provide appropriations for restoring the leased-wire services mentioned and to allow the Bureau to take up certain work which was discontinued, including monthly reports to show the amount of cereals, sugar, and canned goods held in storage, and the city market-reporting service whereby consumers may receive information regarding prices and supplies of fresh foods in important markets.

Between the time of the signing of the armistice and the close of the fiscal year, the Bureau reduced its forces greatly and this process of curtailment has continued steadily through the first months of the present fiscal year. In addition, a large turnover in personnel has taken place. The number of separations in the period indicated exceeded 800, and this added much to the difficulty of performing our work.

As stated in the report for the fiscal year 1918, the regulation of stockyards and live-stock dealers was undertaken by the Department

of Agriculture in response to the proclamation of the President issued on June 18, 1918. The Chief of the Bureau of Markets was designated by the Secretary to administer the supervision of licensees under this proclamation. Supervisors have been stationed in 26 of the most important live-stock markets and in 121 additional stock-yards. In the course of this work it has been possible to recommend and bring about many specific economies and improvements, and the mere fact that the regulations were being enforced caused the voluntary elimination of many irregularities and injurious practices.

The data gathered in the food supply investigations, which have been carried on for the last two years, have been arranged in a series of reports dealing with various phases of the processes of marketing live stock and grain, and several of these reports have been sent to the Federal Trade Commission to be used in connection with their reports on various phases of the food supply situation. The further prosecution of this work should lead to additional valuable results.

The distribution of nitrate of soda, originally undertaken in the 1918 season, was continued during the spring and summer of 1919. On the basis of prevailing retail prices, as reported to the Department, it is estimated that this work saved to the farmers of the country approximately \$2,000,000 during the last year alone. Nearly 153,000 tons of nitrate were distributed this year at the price of \$81 per short ton f. o. b. shipping point.

Butter was added to the commodities upon which the Bureau rendered an inspection service during the past year, though such inspections were instituted on a very modest scale, on account of the lack of funds. This service was conducted in New York, Philadelphia, Chicago, and Minneapolis and will be extended to other important markets when increased appropriations become available.

By Executive order dated December 31, 1918, the work of the domestic wool section of the War Industries Board was transferred to the Bureau of Markets for completion. The accounts received from dealers are being audited, and the excess profits made by them will be collected and distributed to the producers. It is anticipated that this work will be virtually completed during the fiscal year ending June 30, 1920.

On March 4, 1919, the cotton futures act was amended so as to limit the grades deliverable on future contracts to 10; to provide for the classification by the Department of Agriculture of all cotton delivered on future contracts on the exchanges at New York and New Orleans, entered into after March 4, 1919; and to give the Secretary of Agriculture additional authority to conduct investigations as to the purchase and sale of spot cotton in order to secure accurate quotations of the prices of the various grades. This legislation was passed because it was thought that the tenderability of certain low-grade cotton served to depress the value of contracts, because it was considered desirable to avoid the expense and delay involved in the settlement of contracts under the former plan of classification and determination of disputes, because it was believed that these steps would enhance the value of the contract both intrinsically and through increased public confidence, and because the securing and publishing of accurate quotations for spot cotton, particularly of nontenderable grades, was deemed to be of very great importance to producers and the trade.

For the sake of convenience the work of the Bureau is shown in the following detailed report under three classifications: (1) Investigational and demonstrational; (2) service; and (3) regulatory.

INVESTIGATIONAL AND DEMONSTRATIONAL WORK.

FOOD SUPPLY INVESTIGATIONS.

During the year the work of this project, which was supervised by Mr. C. S. Cole, consisted largely of the preparation of reports from the data which were obtained during the previous year and which were discussed fully in the Bureau's annual report for the fiscal year 1918. Some of these reports have been transmitted to the Federal Trade Commission for use in connection with their reports on various phases of the food-supply situation.

One report, based on records of 880 shipments of cattle, hogs, and sheep, deals with questions of transportation, shrinkage, commission charges, and miscellaneous expenses. It compares the costs of such shipments by seasons and by classes of dealers concerned, and is valuable in indicating the most economical methods of marketing live stock.

Records taken from the books of 139 elevators in Illinois and Iowa, covering a period of five years, have been analyzed in another report which deals with general expenses, profits, the seasonal flow of grain, and buying margins between country and terminal markets. This report is practically ready for publication.

The relation of so-called "wirehouses" to future trading and to the cash grain business is discussed in another report which analyzes such establishments to determine their place as a factor in terminal grain marketing and their economic usefulness. A map has been prepared showing the ramifications of the private wires centering in Chicago.

A report on terminal elevators discusses their relation to other factors in the Chicago market. It contains a summary of figures which were taken from the books of several large terminal elevators and which show the results of mixing and conditioning grain, the sources from which grain comes and to whom it is sold. The figures relating to the mixing and conditioning of grain are probably the most authentic and comprehensive ever gathered.

Figures were abstracted from the books of five large line elevators in Minneapolis dealing with 265 country stations that show the grades, weights, and dockage assessed at the country station and at the terminal. These figures cover a period of five years and include 43,000,000 bushels of various grains.

COOPERATIVE PURCHASING AND MARKETING.

This work during the latter part of the fiscal year ended June 30, 1919, was supervised by Mr. O. B. Jesness, succeeding Mr. C. E. Bassett, who resigned in December, 1918.

Personal assistance has been given in the solution of many organization problems; for example, assistance was given to dairy farmers in New England in preparing organization plans, and work of the same character was done with peanut growers in Virginia and North Carolina, bean producers in New York and Colorado, and potato growers in Michigan.

Organization problems were discussed and explained at a number of general gatherings, such as farmers' week and farm bureau meetings. Existing organizations were helped, and information relative to organization questions was supplied to a large number of individuals in this way.

A number of cooperative marketing organizations were visited to obtain information with regard to their form of organization, method of operation and problems encountered, and the general survey of cooperation in the United States, started some years ago, was continued.

State cooperative laws were studied and suggestions in regard to such legislation were given upon request. The suggested cooperative law published in Service and Regulatory Announcements No. 20 (1917) has formed the basis for at least two State laws in force at the present time, and the legislature of a third State has passed a similar law which has just been approved by the governor. Similar legislation has been under consideration in other States during recent sessions of the legislatures.

CITY MARKETING AND DISTRIBUTION.

Concentration of public interest on the high cost of food during the past year has caused a number of municipalities to take under consideration the matter of publicly owned retail markets as a means for obtaining lower prices and more efficient distribution. As a result, the project "City Marketing and Distribution," under the leadership of Mr. G. V. Branch, has been called upon during the fiscal year for surveys, information, and advice in regard to food distribution problems. Work of this nature has been carried on in Cleveland, Akron, and Toledo, Ohio; Jacksonville, Key West, Miami, and St. Augustine, Fla.; Indianapolis, Ind.; Wilkes-Barre, Pa., and Richmond, Va. In the city last named a comprehensive program for the betterment of its public market system was formulated and plans were furnished for the improvement of existing structures and for the installation of refrigeration and cold-storage facilities. The results of this work should be useful in solving comparable problems in other communities. Information and advice also have been given to other municipal governments and to market committees, farmers' organizations, and others.

Studies made in various cities indicate that meats and dairy products may be handled in their public markets at less expense to the dealer than in outside stores. The problem remains, and is receiving earnest attention, to see that the consumers participate in the savings effected by the dealers.

A number of specific market engineering problems received attention during the year and progress was made in perfecting a combined glass-covered refrigerated display and storage counter for meats, especially suited for installation in public retail markets. Studies made during the year added to the information upon which designs and estimates for market layouts, structures, and equipment must be based.

To help cities in establishing farmers' markets considerable attention has been given to the study of existing market ordinances, and an endeavor has been made to prepare a suggestive ordinance which

incorporates necessary and practical provisions for the successful establishment, financing, and operation of such markets.

Investigations were carried on in various types of retail establishments handling farm products because the cost of operation in food-retailing shops is obviously an important factor in the ultimate cost of food to consumers and because the degree of efficiency attained in such operation affects the whole distribution system. Particular attention was given to what may be termed the improved methods of retail distribution, including the so-called "Four-square plan," "Self-service," "Cash and carry," etc.

The marked development of self-service stores in recent years constitutes one of the outstanding features in present-day retail marketing of food. The system is economical of man power and seems to give promise of appreciably lower prices to consumers. Little has been known generally, however, about the actual savings and the principles and methods upon which these stores depend, and the Bureau has received numerous inquiries in regard to these points. Investigations, consequently, were carried on in practically all sections of the United States in which the development of these agencies has been marked.

TRANSPORTATION AND STORAGE.

The transportation work of the Bureau is directed by Mr. G. C. White.

As in previous years, the perfecting of arrangements with common carriers for reports to be used in connection with the Bureau's market news services occupied the major portion of the time and efforts of the workers on this project. Five hundred and ninety-four common carriers made reports to the Bureau, these carriers controlling 248,722 miles, which for practical purposes is the entire mileage of the United States. The term common carrier as used in this connection includes railroads, express companies, and boat lines.

The storage work of the project was interrupted by the detail of the specialist in storage to the War Department in the latter part of October, 1918. Up to that date regulatory measures had been devised, in cooperation with the United States Food Administration, for the control of the cold-storage industry, and plans for the transportation of meats to the fighting front had been worked out in cooperation with the War Department. In order to continue the storage work, an assistant in cold-storage methods and costs was appointed temporarily and spent the remainder of the year, in cooperation with the project "Market Business Practice," in working out a system of uniform accounting for cold-storage plants.

DIRECT MARKETING ACTIVITIES.

The general aim in this work, which was under the supervision of Mr. Lewis B. Flohr, was to ascertain, analyze, and classify the factors that operate for or against the successful marketing of farm produce by parcel post or express from producers direct to consumers; to determine definitely the limitations of direct marketing both from physical and economic standpoints; and to diffuse useful information to interested persons.

During the year experimental shipments to the number of 303, involving 18 commodities and aggregating in weight 6,856½ pounds,

were made by parcel post and express over distances totaling 63,164 miles. The purpose in making these shipments was to obtain first-hand information as to the physical condition of farm produce transported by parcel post and express and to test the efficiency of different kinds of shipping containers. In nearly every instance the success of the shipments depended on the quality of the product, the type of container, care used in packing and transporting, and length of time in transit. The value of a commodity in proportion to its weight and the price which it will bring are factors which must be considered in determining the desirability of marketing by parcel post and express.

Field studies were made in the vicinity of Detroit, Mich., and on the rural parcel post motor routes from Washington, D. C., to McConnellsburg, Pa., to determine the possibilities of the direct marketing of farm products by motor truck, and to ascertain the relative success of efforts that have been made to popularize direct marketing.

In the New England States and in eastern New York work was conducted for the purpose of bringing producers and consumers into business contact. Lists of names and addresses of farmers, with the kinds of products they had for sale, were compiled, and copies of these lists were supplied to consumers in cities. Lists giving consumers' names, addresses, and products wanted were supplied to producers. Similar work was conducted for six months in western New York with Rochester, Corning, and Lockport as consuming centers.

During the year study was completed regarding the marketing of dressed poultry and meats by parcel post, and, in cooperation with the States Relations Service, assistance has been given to extension workers in solving problems relating to the marketing of boys' and girls' club products.

Studies have been made regarding the marketing of home and club canned goods, drug plants, moss, mushrooms, nuts, sirups, and teasel heads.

MOTOR TRANSPORTATION OF FARM PRODUCTS.

This work was started in March, 1918, and was continued up to the close of the fiscal year 1919 under the direction of Mr. J. H. Collins.

Widespread popular interest has for some time been manifested in agricultural districts in the possibilities of obtaining more direct transportation service through more complete utilization of our highways, and this work was designed to assist in the development of this movement along proper lines. Direct cooperation was maintained with owners and operators of existing motor-truck routes.

An accounting system designed to indicate costs of operation and approved forms for shipping records were devised for the use of operators of motor routes. Emphasis was placed on the necessity for the adequate insurance of cargoes, and provisions to be incorporated in cargo insurance policies were suggested after consultation with responsible underwriters. The advantages resulting from the use of proper terminal facilities were pointed out, and the possibilities of establishing central terminal facilities for all routes in certain cities were investigated. Eight demonstration routes were established and operated successfully. Studies also were made of

the operation of farmers' cooperative truck associations, and a preliminary survey of the marketing of live stock by motor truck was conducted in certain live-stock centers. This study, which was completed during the fiscal year, was principally confined to farm areas in New Jersey, Maryland, Pennsylvania, western New York, northern Ohio, and eastern Nebraska. Two bulletins listed at the end of this report were published and give results of this study. These publications have been in wide demand.

MARKET BUSINESS PRACTICE.

The work of this project was somewhat interrupted during the year by the loss of technical men through resignation, enlistment in the military service, or assignment to other war work. On account of this condition, a large portion of the regular work was suspended.

As a result of the past three years' work a manuscript outlining a uniform classification of accounts for creameries has been prepared. This manuscript discusses many of the undesirable business practices employed by creamery managers and points out the procedure which should be followed.

Further investigation of the accounting and business practices of milk-distributing plants has been made, and advice regarding proper procedure and methods has been given to a number of plants. The procedure under the system installed for experimental operation at Grand Rapids, Mich., and at Burlington, Vt., has been carefully observed and perfected.

The operation of a tentative system of accounting for purchasing organizations and cooperative stores has been carefully studied and as a result a manuscript describing the accounting methods and business practices of such organizations has been prepared.

With the promulgation of official grades for grain, it became evident that it would be desirable to revise the methods of accounting which were recommended for grain elevators outlined in Department Bulletin No. 362, and after a great deal of study a manuscript suggesting changes was prepared. In addition to this, the methods employed in marketing grain in the Pacific northwest were studied with a view to devising a system of accounting to meet the peculiar needs of that section.

A tentative system of accounting for cold-storage plants was devised and installed for experimental operation at Boston, Mass., and has been carefully watched during the year. Extensive investigations of the business practices and accounting methods of cold-storage plants have been conducted, and numerous conferences have been held with leaders of the industry.

Investigations of the methods of accounting used by and the business practices of commission houses and handlers of perishable fruits and vegetables were completed, and tentative accounting systems were installed in eight organizations for experimental operation.

As a result of extensive investigation regarding the accounting needs of cotton gin operators, a system of accounting for such agencies has been devised and is now ready for experimental operation.

Methods of demonstrating the work in accounting and business practice have been given careful consideration and it should be possible to obtain very good results by using the bulletins as a basis for

short courses for managers and bookkeepers of marketing organizations. A large number of State schools and colleges have expressed a desire for material of this character upon which to base such courses.

FOREIGN MARKETING INVESTIGATIONS.

The signing of the armistice on November 11, 1918, marked the beginning of unusual activity among producers and exporters in preparation for the resumption of foreign trade, and extensive demands have been made for information concerning foreign marketing conditions. Studies were made regarding the marketing in foreign countries of such American agricultural products as grain, grain products, rice, seeds, cotton, vegetable oils, oil cake, dairy products, live stock, and meats; fresh, dried, and canned fruits and vegetables; and honey, nuts, and leaf tobacco. A large number of official and private foreign publications were reviewed regularly and abstracts and translations were made from them for use in answering correspondence and for publication. The work of this project was directed by Mr. C. W. Moomaw.

Statistics covering exports of agricultural products from the United States by 10-day periods were tabulated during the year, although this work was discontinued in June. Information assembled from steamship manifests at the New York customhouse was used in the publication of daily and weekly reports on the current exports and imports of live stock, meats, dairy products, grain, fruits, and vegetables.

Cooperation was maintained with an interdepartmental committee appointed to classify the export and import statistics published by the Department of Commerce, and for several months work was done in the revision of the classification for agricultural commodities. It is expected that this reclassification will be put into effect January 1, 1920.

To meet the demand for information on foreign markets the publication of a weekly circular entitled "Reports on Foreign Markets for Agricultural Products" was commenced in March, 1919. This publication has been widely circulated and favorably received.

An investigation concerning the fruit markets in Australia and New Zealand was completed in November, 1918, and a report on this subject was prepared for publication. Coincident with this investigation the live stock, meat, wool, and dairying industries of Australasia were studied.

As a result of representations made by an investigator of this Bureau through the American consul general at Auckland, the Government of New Zealand opened its markets to American grapes, which previously had not been allowed entry into that country.

In cooperation with the project "Marketing Live Stock, Meats, and Animal By-Products," an investigator was sent abroad to study the conditions in the live stock, meat, and dairy industries of the United Kingdom and Europe, and to estimate the possible demands upon America during the readjustment period. During the visit of this representative to France the Ministry of Agriculture removed existing restrictions against the importation of American cattle and placed an order in the United States for large numbers of dairy cattle. This Bureau also was instrumental in making an arrange-

ment with the United States Shipping Board whereby these cattle could be shipped to France.

In June, 1919, in cooperation with the project mentioned above, representatives were sent to South America to study the markets for American purebred live stock. In connection with this work attractively illustrated booklets printed in Spanish and Portuguese were issued dealing with the purebred live-stock industry of the United States.

At the request of the relief commission the Bureau of Markets, in February, 1919, sent a grain expert to Europe to assist in estimating the crop and food conditions in the central countries.

In May, 1919, an agricultural trade commissioner was sent to the United Kingdom to study the markets for American agricultural products in that region and to make regular reports by letter and cable on this subject for the information of the American public. Representatives of the same sort should be placed in France, Italy, and Denmark for work in central, southern, and northern Europe, but at present funds will not permit this expansion.

RURAL COOPERATION.

This work was prosecuted under the supervision of Mr. C. W. Thompson during the past fiscal year. The supervision and direction of the investigations concerning rural insurance, rural telephone companies, and rural social and educational activities was, at the end of the year, transferred to the Office of Farm Management in accordance with the plans of the department for an enlargement of the field of that office to include all studies pertaining to farm economics and farm life. The rural credit investigations were discontinued since Congress failed to appropriate funds for the further prosecution of this work.

RURAL CREDIT, INSURANCE, AND COMMUNICATION.

During the fiscal year 1919, a study was made of the farm credit extended by banks, assistance was given the Bureau of the Census in the preparation of the 1920 census schedule, press releases and other material relative to farmers' credit unions in the United States were prepared, and a number of articles on rural credit were published.

A model State law was drawn up for farmers' mutual fire insurance companies, a manuscript for a bulletin on prevailing plans and practices among farmers' mutual fire insurance companies was prepared, a suggested system of records for such companies was completed, assistance was given in the formation of two new State associations of mutual insurance companies, and special attention was given to the study of hail insurance and other special forms of agricultural insurance.

RURAL SOCIAL AND EDUCATIONAL ACTIVITIES.

Information was assembled regarding the more important farmers' organizations for promoting rural social and educational activities, a list of State and local fairs was compiled and brought down to date, the study of rural community buildings was continued, and a bulletin on this subject was prepared for publication.

FOOD SURVEYS.

The food-survey work, conducted under the authority of the food production act and directly supervised by Mr. C. W. Thompson, was brought to a close on June 30, 1919, with the expiration of the emergency appropriation.

Monthly reports of commercial stocks of foodstuffs in the hands of selected classes of business concerns were published throughout the year in a periodical entitled "Food Surveys." These reports covered 22 different commodities and were based upon schedules received from about 20,000 firms each month.

General surveys were made as of July 1, 1918, and January 1, 1919, covering 67 and 68 commodities, respectively. The survey of July 1, 1918, included retail dealers, while that of January 1, 1919, was confined to manufacturers, storage establishments, and wholesale dealers. The data obtained through these surveys were published in considerable detail in special issues of "Food Surveys," with diagrams presenting the most significant facts in graphic form.

Tabulation of the results of the household survey, for which the schedules were assembled in the early part of 1918, was completed and a report was prepared comprising tables, diagrams, and explanatory text, and showing per capita consumption and household stocks per family.

Reports regarding the amount of wheat and other grains thrashed in the United States were secured from thrashermen, in cooperation with the States Relations Service, and the results of this inquiry were supplied to the Bureau of Crop Estimates.

COOPERATION WITH THE STATES IN MARKETING WORK.

The Bureau of Markets cooperated with 22 States in the conduct of marketing work during the fiscal year 1919—namely, Arkansas, Colorado, Connecticut, Georgia, Indiana, Iowa, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, New Mexico, North Carolina, Ohio, Oregon, Tennessee, Texas, Vermont, Virginia, and Washington.

The marketing work in each of these States is under the immediate leadership of a State agent in marketing, whose function it is to assist in coordinating the marketing work done by various agencies in the State concerned. In the majority of the States these agents have assistants engaged on special phases of marketing, four or five men being employed in some cases.

During the fiscal year 1919, Mr. J. C. Skinner represented the Bureau of Markets in the administration and supervision of this work from Washington. In some States general surveys were conducted to obtain information regarding the marketing methods in use and the kinds of assistance most needed. Special investigations regarding the marketing of specific commodities have been conducted from time to time. The State agent in marketing acts as a clearing house for information regarding supply and demand, markets for all sorts of farm produce, and many other matters.

In many States assistance was given in the organization of live-stock shipping and other cooperative associations. By-laws for such associations were prepared and accounting systems installed to insure the businesslike management of such agencies. A great deal of

work was done in the drought areas of the West in locating supplies of hay and feed to be shipped to owners of stock. The United States Railroad Administration assisted in this work by allowing a half freight rate. In the Southern States much work has been done to interest the growers of sweet potatoes in building storage houses to prevent the waste which now occurs in connection with the storage of this crop. Demonstrations of packing and grading fruits, vegetables, and grain have been held and other work has been done to promote better marketing methods.

MARKET GRADES AND STANDARDS FOR FRUITS AND VEGETABLES.

Under this project, which was directed by Messrs. W. M. Scott and C. T. More, the Bureau continued its investigations of the harvesting, grading, packing, and shipping of fruits and vegetables. The scope of the work during the past year, however, was relatively limited because of the loss of experienced men to the military and naval services.

Throughout the country an increasing interest has been shown in uniform grades for fruits and vegetables. The work of the United States Food Administration in enforcing the acceptance of shipments and adjusting claims and the results brought about by the operation of the Food Products Inspection Service did much to demonstrate the necessity of establishing definite standards.

In the principal apple-producing sections of the country information was gathered for use in making specifications for grades of both barreled and boxed apples. As a result of the investigations in the eastern part of the country, a bulletin has been prepared dealing with the preparation of barreled apples for market. Recommendations regarding improved equipment and operating methods for central packing houses in the East have been made. In cooperation with the West Virginia Agricultural College tentative plans were drawn for the erection of a demonstration packing house in the State, and methods for equipping it were recommended. In the Western States a keen interest has been shown in securing uniform State apple grades, and recommendations were recently made at a western conference that uniform grades for boxed apples be established.

Investigations carried on in Georgia and Virginia developed the need of an improved type of peach-sizing machine, and such a machine was built and installed in Georgia. An improved model is now being perfected and the study of peach grading and peach packing houses has been continued.

On January 31, 1918, orders were issued making compulsory upon the part of licensees of the United States Food Administration the use of the potato grades prepared by the Bureau of Markets, which were jointly recommended by the Department of Agriculture and the Food Administration in September, 1917. Following the signing of the armistice these regulations were canceled. A striking improvement in the grading of potatoes resulted from the recommendation and promulgation of these standards, and the best indication of the need for national standard grades is the fact that these grades for potatoes are still voluntarily in as wide use as they were before the regulations making their use compulsory were canceled six months ago. Several States have adopted these grades and made their use compulsory. As a result of continued demonstrational and investiga-

tional work minor changes in these grades were recommended on February 10, 1919, and specifications for a fancy grade have been worked out. This fancy grade will be used largely for the large, smooth, bright potatoes produced in the irrigated sections of the West.

The grades recommended by the Bureau of Markets for domestic Bermuda onions were again used by the Texas State inspectors during the past season. The grading of northern or late onions is now being studied in order that grade specifications may be recommended by the end of the 1919 season.

Investigations of the grading of tomatoes, cabbage, and of some other vegetable crops have progressed to the point where it is believed that grade specifications can be recommended in time for use during the next harvesting season.

Study of the containers used in the marketing of perishables has progressed in a very satisfactory manner during the past fiscal year. Growers, shippers, manufacturers, and the produce trade are showing a greatly increased interest in package standardization.

PRESERVATION OF FRUITS AND VEGETABLES IN TRANSIT AND STORAGE.

During the greater part of the fiscal year 1919 this work was under the supervision of Mr. H. J. Ramsey and after his resignation was directed jointly by Messrs. C. W. Mann and A. W. McKay. Anticipating the fact that the funds for this project would be greatly reduced by the elimination of the emergency appropriation on June 30, 1919, it was necessary to adopt a policy of curtailment during the closing months of the past fiscal year and to dismiss many trained investigators.

Particular attention was given to the methods of handling potatoes in the Delta section of California; cantaloupes in California, Arizona, Colorado, and Indiana; and lettuce, tomatoes, spinach, and onions in the Gulf States and Florida. Demonstrations were made to point out to growers that decay in the transportation of these products is primarily due to faulty methods of handling and refrigerating. Marked reductions in losses resulted from the application of more careful methods of digging and grading potatoes and the maintenance of suitable temperature in refrigerator cars and storage houses and by effecting certain improvements in the handling of lettuce, such as the more complete removal of the lower leaves of each head in harvesting, and shipment in ventilated crates instead of closed hampers. It was found that the decay of strawberries in transit results largely from avoidable injuries inflicted in picking and washing operations and from inefficient refrigeration.

Additional data were secured regarding the effect on the keeping qualities of perishables of various types of refrigerator cars, methods of loading, etc. Vegetables from the South shipped in properly constructed cars cooled 1° an hour faster than those forwarded in cars of the ordinary type and deteriorated less than one-third as much. Experimental shipments to determine the practicability of the use of salt and ice to secure more rapid cooling were continued, and a survey of icing stations was undertaken with a view to suggesting means of reducing present losses of ice.

The fundamental principles underlying the proper design and construction of heater cars for use in the northern sections of the

country, where severe losses occur in shipments during cold weather, were carefully studied in a special testing plant equipped by the Bureau for this purpose at Roseville, Calif. Specifications for heater cars, based on the results of these tests, have been adopted by the Railroad Administration.

Investigations and demonstrations regarding the factors underlying the successful storage of fruits and vegetables were continued. In the Pacific northwest and in Colorado 40 common storage houses for apples and more than 200 potato-storage houses and cellars were built or modified in accordance with plans or suggestions furnished by this Bureau, and the capacity of sweet potato storage houses built in the South directly or partly as a result of this demonstrational work amounts to about 3,000,000 bushels.

The introduction several years ago by the Department of methods of packing California grapes in redwood sawdust resulted in extending the marketing season of such grapes nearly three months and in widening the possible area of distribution. On account of a shortage of redwood, efforts have been made to find a substitute, with the result that spruce, a material hitherto untried, has been found to be very effective. Further demonstration of the practical value of spruce packing will be made next season. The curtailment of this grape-growing industry from the lack of a suitable filler will be avoided should spruce, of which there is a very large supply on the Pacific coast, prove to be as satisfactory a packing material as redwood.

Comprehensive investigations have been conducted to determine the best methods of handling fruits and vegetables which have been injured by freezing in transit, and demonstrations have been made to illustrate practicable methods of salvaging frozen or partly frozen products, attention being called to the possibility of their use both for food and manufacturing purposes. The temperatures at which various products freeze or are injured by excessive chilling have been studied and preliminary investigations have been carried on to determine the factors which affect the keeping quality of fruits and vegetables preserved by freezing storage.

DAILY MAIL REPORTS OF CAR-LOT SHIPMENTS OF FRUITS AND VEGETABLES.

UNLOAD REPORTS.

Daily mail reports of car-lot shipments of all fresh and dried fruits and vegetables have been obtained from common carriers during the past fiscal year. The railroad lines, express companies, and the principal boat lines originating such shipments have cooperated heartily in this work. The scope of these mail reports grew during the year, so that about 110 different commodities are now included, and approximately three-fourths of a million carloads of fresh and dried fruits and vegetables were reported. It was found necessary during the fiscal year to discontinue the publication of the semi-weekly shipment report, which was based on these daily mail reports.

The reports of fruits and vegetables unloaded in 16 of the principal markets have been somewhat diminished in scope during the past year and are now obtained for the following commodities only: Apples, cabbage, cantaloupes, celery, onions, peaches, strawberries, tomatoes, white potatoes. This project is supervised by Mr. W. A. Sherman.

MARKETING DAIRY PRODUCTS.

The work of this project was supervised by Mr. R. C. Potts during the fiscal year 1919.

Surveys of milk-marketing conditions, including the sources and amount of available supplies, the demand for and methods of distributing fluid milk and cream, were made at Sedalia and Kansas City, Mo.; Leavenworth and Kansas City, Kans.; and Cumberland, Md. Reports on these surveys were prepared and recommendations were made for the improvement of marketing methods and conditions in the cities named.

Special attention was given to problems connected with the business management and operation of city milk-distributing plants, especially those owned and operated by farmers' cooperative companies.

Field campaigns to increase the demand for and distribution of cottage cheese were conducted in New York, Massachusetts, and Connecticut with most satisfactory results.

Special investigations were made of the production, consumption, and prices of casein in the United States to determine the possibility of furnishing adequate supplies for war needs by domestic production. The results of the investigations were made available to the Aircraft Construction Division of the Navy Department and to the War Trade Board.

The size of existing stocks and the prices of milk powder were investigated for the purpose of obtaining definite information regarding market conditions which were reported to be injurious to the development of the milk powder industry. Investigations proved, however, that the alleged conditions did not exist.

Studies of the sources of supply, production, demand, prices, and market conditions of butter and cheese were made. It is hoped that complete statistics on this subject may be published for the years 1917 and 1918.

MARKETING LIVE STOCK, MEATS, AND ANIMAL BY-PRODUCTS.

This project is under the supervision of Mr. Louis D. Hall and furnishes the fundamental information upon which the market news service and the regulatory work connected with live stock and meats are based. The information obtained by this project served as a guide in preparing the regulations governing licensees operating stockyards or dealing in live or dead stock at stockyards and was useful in planning and directing the stockyards' supervision service.

A survey of the marketing of purebred live stock in the United States was begun early in the fiscal year in order that the Bureau might be prepared to render assistance in reestablishing the live-stock industry in the devastated countries of Europe. As a result of this survey, information was made available showing the location by counties of the majority of breeders engaged in the production of each of the principal breeds of live stock. This information is being used to aid buyers and sellers in both domestic and foreign trade.

The detailed study of the problem of marketing soft pork which was begun during the latter part of the last fiscal year was continued in order to determine a basis for the difference in prices which should be paid for live hogs classed as "soft" or "oily" and those classed

as "firm." The results of this study now are being prepared for publication.

An investigation was made in cooperation with the Bureau of Animal Industry and the Bureau of Chemistry to determine the reasons for numerous complaints regarding the country hide situation, especially with reference to the physical condition of country hides and skins and the apparent discrimination in the prices for these products, both at the farm and on the market, and to ascertain what improvements could be effected. As a result of this work a bulletin was prepared and educational posters bearing general instructions regarding proper methods of skinning, curing, and marketing hides were printed for distribution.

A preliminary, country-wide study has been made to obtain definite facts relating to the various types of retail meat stores and more complete information relative to the costs of distributing meats at retail.

Careful studies were made of the present commercial grades for wool, and a collection of samples was made preparatory to the development of tentative standards for various grades of wool. Circulars were prepared and distributed suggesting better methods of preparing and marketing wool, and direct marketing was encouraged where possible by putting wool producers into possession of information regarding direct channels for marketing their clips. During the war active cooperation was maintained in connection with this work with the War and Navy Departments, the Council of National Defense, War Trade Board, War Industries Board, Shipping Board, and Tariff Commission.

GRAIN MARKETING INVESTIGATIONS.

Emergency activities of pressing nature made it necessary to restrict in a measure this investigational work. Mr. C. S. Cole supervised the project during the past fiscal year.

Studies of the methods of marketing grain sorghums, the kind marketed, and the demand for and uses of such grains were carried on in the principal producing and consuming sections. These investigations show that milo and kafir are the principal grains used to feed all classes of live stock in producing sections, and also are used in practically all mixed poultry feeds in the leading poultry sections of the United States. These grains also are used in the manufacture of starch and alcohol and for human food.

Investigations of a preliminary character have been carried on with regard to the marketing of broom corn. Information has been obtained from local freight agents regarding the amount of standard and dwarf varieties shipped from stations in important producing territories, and the uses and distribution of broom corn have been studied as a basis for more specialized future investigations.

SEED MARKETING INVESTIGATIONS.

During the first half of the fiscal year ending June 30, 1919, investigations were made to determine the effects of the war on commercial seed production, seed imports and exports, domestic demand, size of stocks carried, prices, etc.

A study has been made of seed marketing on the farm and much information has been obtained. Among other things, these data include, in percentages for the various classes of seed, the sources of the farmers' seed supply in every State and show how he prepares and disposes of his seeds.

Some of the leading seed markets in Europe were visited in order to make recommendations for increasing and stabilizing, if possible, the seed trade between the United States and European countries.

Production and consumption maps for clovers, grasses, millets, sorghos, cowpeas, Canada field peas, and soy beans were prepared in order to show the counties normally having a surplus, sufficiency, or deficiency of each of the kinds of seeds.

These investigations were supervised by Mr. W. A. Wheeler.

GRAIN STANDARDIZATION AND GRAIN HANDLING AND TRANSPORTATION.

During the last fiscal year investigations were made of factors to be considered in formulating standard grades of oats, barley, rice, and flaxseed. This and other related work, as well as certain investigations regarding grain handling and transportation, were supervised by Mr. S. A. Regan.

As a result of the investigations concerning oats, official standards for this grain were promulgated under date of March 14, 1919, to become effective June 16, 1919. Before promulgating the standards a series of hearings were held throughout the United States to obtain the opinion of the grain trade as to their workability.

Specifications for tentative or permissive standards for milled rice were prepared and announced in Markets Document No. 15, issued September, 1918. A supplemental publication relating to standards and entitled "Instructions for the Sampling, Handling, Analyzing, and Grading of Samples of Milled Rice" was published as Markets Document No. 16, in October, 1918. These standards were adopted by the United States Food Administration and used by its rice committee in grading all rice purchased by the Government for the Army, Navy, Belgian relief, and the allied nations. The several rice-grading offices of the United States Food Administration were visited from time to time and instructions in grading were given so that the tentative standards might be correctly interpreted.

Much work has been done to determine the practicability of cleaning grain by means of special attachments on thrashing machines. These investigations have resulted in the development of a special pneumatic cleaner to be attached to the thrashing machine, which is proving effective.

Careful investigations have been made to determine the effect of storing wheat and barley in concrete and steel bins. These studies were conducted in cooperation with the Food Administration Grain Corporation. Manitoba wheat, containing approximately 15 per cent of moisture, was placed in large steel tanks holding over 100,000 bushels. This wheat kept sweet for several weeks, although the temperature of the air beneath the steel roofs during warm, bright days reached 120° F. and higher during midday. There was no apparent change in the wheat except that it lost moisture around the steel sides and on top of the grain. This wheat was later transferred to concrete tanks and its behavior in them is being studied.

A cargo of wheat was accompanied from Philadelphia to Genoa, Italy, to determine the effect of grade factors on the keeping qualities of different lots of wheat during ocean transportation. In this connection, two other cargoes of wheat shipped from the United States were sampled at the Italian port of arrival and information was obtained on their condition at the time of discharge. The data on this work are being assembled for study in connection with efforts to assure the arrival of American grain in good condition in foreign ports and to perfect the grain standards to meet the requirements of ocean transportation. Samples have been collected from a boat loading at Astoria, Oreg., to determine the carrying qualities of the western-grown wheats which will pass through the Panama Canal to Europe.

COTTON HANDLING AND MARKETING.

The investigational and demonstrational work connected with cotton handling and marketing was conducted during the past year under the direction of Mr. Fred Taylor and later, owing to Mr. Taylor's resignation, by Mr. D. E. Earle. Mr. Taylor also supervised, until his departure, the projects "Marketing Cotton Seed and its Products," "Investigation and Demonstration of Cotton Standards," "Cotton Testing," and "Preparation and Distribution of Official Cotton Standards."

Demonstrations have been made to acquaint producers with the desirability of classifying their cotton before sale and to teach them how to use market quotations in determining the value of their crop. Approximately 236,360 bales were classed in this work in Texas, Arkansas, Louisiana, Mississippi, North Carolina, and South Carolina during the cotton season 1918-19. In addition to this, representatives of the Bureau assisted in organizing growers on a community basis, demonstrated the depressing effect of short-staple varieties upon prices, and pointed out losses incident to improper ginning, baling, and storing. This work has resulted in the enactment of State laws for the betterment of cotton-marketing conditions, especially in Texas, Arkansas, North Carolina, and South Carolina. These activities were conducted in cooperation with the extension divisions in the various States.

Texas growers, producing cotton of good staple and marketing it cooperatively, receive from $1\frac{1}{4}$ to 8 cents more for their cotton than was received for other cotton grown in the same community and sold by individual farmers.

A complete survey was made in Arkansas to determine the character of cotton produced and the conditions under which it was marketed. Approximately 76,500 bales of cotton were classed at Little Rock from samples sent in by ginners from 70 different counties of the State. A detailed study of the information gathered in this survey is being made for the benefit of the growers. The commissioner of mines, manufactures, and agriculture and the extension forces of the State cooperated actively in this work.

About 93 growers of Mississippi and Louisiana formed a cooperative association, and with the aid of a director of the Louisiana extension service and a representative of this Bureau, availed themselves of the advantages of marketing on the basis of grade and staple. Many of these planters used the classifications made by this repre-

sentative in the course of his demonstrational work as a basis for settlement with their tenants.

Demonstrational cotton marketing work was carried on last season at Raleigh, with branch offices at Tarboro, Wilson, and Lumberton, N. C., and at Darlington, Sumter, and Orangeburg, S. C. Approximately 85,000 bales were classed in these States. A survey also was made of the mills of both States with a view to determining the kind of cotton consumed, prices paid for such cotton, and the channels through which it was obtained. As a result of several years of continuous investigational and educational work associations have been formed in these States for the purpose of marketing cotton direct. The association at Orangeburg, S. C., has employed a seller who makes outside connections, assembles the cotton in large even-running lots, and sells direct to the representatives of mills and exporters.

MARKETING COTTON SEED AND ITS PRODUCTS.

Efforts to lessen the large amount of foreign matter, which annually is purchased, handled, and transported with cotton seed, have been continued as important economies could be effected if more care were taken in cleaning and protecting this product.

Investigations to determine the practicability of establishing standards for cotton seed have been continued, and an investigation has been undertaken to ascertain the average oil and ammonia content normally contained in seed grown in different sections of the cotton belt. The possession of such knowledge and the use of practical standards would enable millers and producers to trade on the basis of merit. An investigation also was instituted, in cooperation with the Bureau of Chemistry, to determine the relative qualities of different varieties of cotton seed when grown under practically the same conditions. It is hoped that this investigation will enable the Department to promote the growth of varieties that are superior both as to lint and oil.

Investigations have shown that in many instances cotton seed brought to the gin contains a large percentage of moisture. If the seed is not immediately crushed, this moisture often causes damage by inducing fermentation. It has also been found that cotton seed is often sold without reference to the moisture content, which has a most important bearing on its value.

A survey has been started, in cooperation with the Bureau of Plant Industry, to obtain information regarding the world's oleaginous materials and their products. The importation of these commodities into the United States has increased greatly during the past several years. This work was directed by Mr. Fred Taylor, assisted by Mr. C. F. Creswell.

COTTON WAREHOUSING INVESTIGATIONS.

A series of tests to determine the practicability of gin sampling and the extent of the damage sustained by baled cotton when exposed to the weather has been concluded and the results are being prepared for the use of the public. Standard warehouse designs have been prepared and persons adopting them are given the benefit of careful cooperative supervision in an effort to promote the construction of warehouses in accordance with the most advanced ideas. This work should save insurance costs and should aid in obtaining better ware-

house service. A comprehensive bulletin on cotton warehouse design and construction is now in press.

These investigations are directed by Mr. R. L. Nixon.

INVESTIGATION AND DETERMINATION OF COTTON STANDARDS.

This work was supervised by Mr. Fred Taylor, assisted by Mr. D. E. Earle.

On the 25th of October, 1918, grade standards were officially promulgated for Sea Island and American-Egyptian cotton and for length of staple, this action being the result of careful investigations undertaken in previous years.

In Arizona and California investigations were conducted to determine the applicability of the standards for American-Egyptian cotton to the crop of the past season. These investigations showed that the bulk of the 1918-19 crop conformed very closely to the standards. Marketing and shipping conditions were studied and laboratory tests were made to ascertain the moisture content and the breaking strength of the individual fibers of this cotton. Investigations also were made regarding its spinning qualities, waste, breaking strength, and weights upon arrival in the East. In the course of this work approximately 10,000 bales of cotton were classed.

A survey was made during the fiscal year at the principal marketing centers to determine the applicability to the past season's crop of the standards for Sea Island cotton. Several thousand samples were compared with the established standards and were found to conform with them approximately, except in a portion of the lower grades, which were somewhat bluer in color than the corresponding grades in the standards. Authentic information was gathered regarding the crop, prices received, and general marketing conditions.

COTTON TESTING.

The regular cotton-testing work of the Bureau was resumed during the past year after completion of the tests which were made in connection with the production of an improved airplane fabric for the War Department.

Preliminary tests were made to determine the relative spinning values of Sea Island and Meade cotton, which latter compares very favorably with inland Sea Island cotton.

A comparison was made of the manufacturing properties of "Middling Yellow Stained" cotton with an equal grade of cotton which was harvested and ginned before the fiber had reached a normal state of maturity, popularly known as "bolly" cotton. It was found that the total waste, exclusive of tare, from the "Middling Yellow Stained" cotton was 10.6 per cent and the total waste, exclusive of tare, from the "bolly," 16.8 per cent. Tensile strength tests proved that "Middling Yellow Stained" cotton was about 10 per cent stronger than the "bolly" cotton.

At Tempe, Ariz., tests were made to determine the advisability of using artificial humidity during the ginning process. This test showed no difference in the spinning value of the cotton ginned with and without artificial humidity.

This work was supervised by Mr. Fred Taylor assisted by Mr. D. E. Earle.

SERVICE WORK.

MARKET NEWS SERVICES.

Anticipating the discontinuance of emergency appropriations, some of the leased wire circuits of the Bureau, which formerly extended 15,000 miles, were abandoned before the close of the fiscal year 1919. On June 30 the leased wires used in connection with the live-stock news service were discontinued west of Kansas City and south of Cincinnati. The circuits used in connection with the services on fruits and vegetables and dairy products will be closed throughout the West on September 30 if no additional funds are made available. On account of the importance of this work as a factor in promoting the effective provisioning of our great cities with fresh food, and the undesirability of leaving the West and South without reliable market information, Congress has been requested to grant additional funds for this work. The leased wires now extend about 9,000 miles, having been reduced from the mileage mentioned above.

MARKET NEWS SERVICE ON FRUITS AND VEGETABLES.

As stated in the annual report for the fiscal year 1918, this work was greatly expanded with war funds and it was operated on this basis during the greater part of the past fiscal year, although, anticipating the discontinuance of emergency funds, many curtailments were effected during the last half of the year. Mr. W. A. Sherman is in charge of this work.

Reports were issued covering 31 commodities. These reports gave information regarding car-lot shipments, arrivals, and jobbing prices in the principal markets, and f. o. b. prices and other shipping-point information.

The following commodities were included in the program of the past fiscal year:

Apples.	Grapefruit.	Peppers.
Asparagus.	Grapes.	Prunes.
Bunched vegetables.	Green peas.	Spinach.
Cabbage.	Honey (semimonthly).	Strawberries.
Celery.	Lettuce.	String beans.
Cherries.	Mixed fruits.	Sweet potatoes.
Cantaloupes.	Onions.	Tangerines.
Cranberries.	Oranges.	Tomatoes.
Cucumbers.	Peaches.	Watermelons.
Dry beans.	Pears.	White potatoes.
Eggplant.		

During the greater part of the past fiscal year 32 market stations were operated in important consuming centers throughout the United States, as follows:

*Atlanta.	*Detroit.	*New Orleans.
*Birmingham.	* Fargo.	*Oklahoma City.
Boston.	*Fort Worth.	Omaha.
*Buffalo.	*Houston.	Philadelphia.
*Butte.	*Indianapolis.	Pittsburgh.
Chicago.	*Jacksonville.	Portland.
Cincinnati.	Kansas City.	St. Louis.
Cleveland.	Los Angeles.	San Francisco.
*Columbus.	*Memphis.	*Spokane.
Denver.	Minneapolis.	Washington.
*Des Moines.	New York.	

NOTE.—Stations marked with an asterisk discontinued during spring of 1919.

Temporary field stations were operated during the year 1918 at 71 points in the various producing sections during the important car-lot movement of the principal commodities listed above, 82 such stations having been maintained in the previous fiscal year.

There was a marked increase in the number of market reports distributed from market and field stations by telephone and telegraph during the past fiscal year. Subscribers receiving reports by telegraph pay the usual commercial charges on such messages. During the year 1918 the market stations released about 17,000 reports by telephone and 1,100 by telegraph. The temporary field stations in producing sections distributed approximately 2,600 reported by telephone and 1,500 by telegraph.

Approximately 23,000,000 mimeographed daily market reports were issued during 1918 to approximately 125,000 individuals throughout the country.

In addition to the daily market reports, a special "Weekly Review" of the markets was prepared in Washington. This Review was based on daily reports of the movement and prices of the important commodities and showed the trends and tendencies of the markets both in consuming and producing centers. It was sent to about 7,000 interested persons and to leading newspapers, trade publications, and farm journals.

The "Weekly Summary of Car-lot Shipments," showing the movement of the various commodities from each State during the preceding week as compared with the movement of the week previous and of the corresponding periods last year, was sent to transportation officials, members of the trade, educational institutions, and others interested in such statistics.

Semimonthly reports were released to about 3,000 persons interested in the honey shipments and markets.

MARKET NEWS SERVICE ON LIVE STOCK AND MEATS.

The market news service on live stock and meats, which is conducted under the direction of Mr. Louis D. Hall, was much expanded by the use of emergency funds as stated in the annual report for the previous fiscal year. With the expiration of these funds the service was greatly curtailed on July 1, 1919, all leased wires west of Kansas City and south of St. Louis having been closed.

During the year a branch office was established at San Francisco, and the service was extended temporarily to Jacksonville, Fla., Indianapolis, and Cincinnati. By these additions the number of branch offices with leased-wire service was increased to 20. The daily reports on meat trade conditions were continued with the addition of price quotations on wholesale pork and veal cuts. These reports were expanded to include trade conditions and prices at Chicago and San Francisco and a "flash wire" indicating the trend of early trading also was added. Both the daily and weekly reports were improved by condensing the text, which made them more readily useful to the trade. Approximately 3,500,000 copies of each of the various daily reports and 750,000 copies of the weekly reports were distributed during the year.

Early in the fiscal year arrangements were made to issue the report on live-stock loadings from Chicago instead of Washington in order

to expedite the receipt of the information and to reduce operating costs. It also was found desirable to condense and combine certain reports which are now issued as the "Daily Live Stock and Meat Trade News," more than 20,000 copies of which are being distributed each week. This report includes estimated live-stock receipts at 8 to 10 markets for the day on which the report is released, actual receipts of the previous day at the market from whence the report is issued, the disposition of stock received at this market, and meat trade and live-stock conditions and prices at various markets. Monthly receipts and disposition of live stock at public stockyards are compiled and published and arrangements have been made for more complete and uniform reports from stockyards companies. Reports are now received from 79 stockyards in 71 cities.

Reports concerning the "in" and "out" movement of live stock in grazing and feeding districts were continued, and the live-stock feeders in the districts of Lancaster, Pa., northern Colorado, and the Arkansas Valley of Colorado were furnished current information relative to the movement of live stock from their districts.

Owing to urgent demands the telegraphic reporting service, which was begun during the previous year at Chicago, was extended to include the live-stock markets at Kansas City, Omaha, and East St. Louis. This service consists of a series of telegraphic reports issued at intervals during each market day. The early reports give estimated receipts and the later reports give actual market conditions and prices on all classes of live stock. Through the commercial news departments of telegraph companies, the press associations, and other agencies in addition to the Bureau's branch offices, this service is made available to interested persons both at market centers and country points throughout the United States.

Following the armistice there was a general demand that the monthly survey of stocks of hides and skins which was conducted during the war by the Tanners' Council be continued by this Bureau. In January, 1919, this work was undertaken. In the course of this survey information is collected regarding the supply of domestic and foreign hides and skins on hand and in transit at the close of business on the last day of each month as reported by packers, dealers, importers, and tanners. Summaries of these reports are compiled and distributed.

During the fiscal year 1919 reports were issued each quarter showing the stocks of wool held by manufacturers and dealers throughout the United States. These reports also showed the stocks of wool held by the Government on March 31 and June 30, 1919. More than 98 per cent of the manufacturers and dealers in wool submitted statements from which these reports were compiled.

Monthly reports were made of the consumption of wool, these reports having been prepared from schedules returned by 99 per cent of all of the manufacturers in the United States using wool in the production of their goods. A monthly census of the active and idle wool machinery in the United States was commenced in November, 1918. Detailed reports on wool market prices were issued in May and June, 1919, and during the latter part of the year monthly statements were instituted regarding the amount and condition of the wool imported into the United States monthly under the present import classification.

MARKET NEWS SERVICE ON DAIRY AND POULTRY PRODUCTS.

This news service, which is supervised by Mr. Roy C. Potts, was financed from emergency funds in the fiscal year 1919. Daily market reports on butter, eggs, and cheese were issued from Washington and from the branch offices located at Boston, New York, Philadelphia, Chicago, Fond du Lac, Minneapolis, Denver, San Francisco, and Portland. They were sent to a mailing list composed of the names of over 7,000 persons and firms, each of whom had made specific requests for the reports.

The reports also included information regarding stocks in storage in certain markets daily, the stocks existing in the entire country semimonthly, receipts and current trading stocks at the principal distributing markets, receipts of cheese from factories and stocks in the hands of dealers in the primary markets of Wisconsin, and wholesale prices received by butter and cheese dealers in the wholesale distributing markets and by cheese dealers in the primary markets.

HAY AND FEED REPORTING SERVICE.

During the fiscal year 1918-19 the Hay and Feed Reporting Service, supervised by Mr. C. S. Cole, with field offices at Washington, Atlanta, Fort Worth, Minneapolis, Chicago, Kansas City, Spokane, and San Francisco, published a "Weekly Market Review" of prices, and conditions affecting them, in the principal markets of the country.

This Review was mailed on Saturday of each week to approximately 12,000 producers, dealers, and consumers of hay, feed, and grain who requested it. Special attention was given in this Review to supply of and demand for hay and feed.

On account of a serious emergency caused by drought, offices were established during the year at Bozeman, Mont., and Fort Worth, Tex., through which 5,047 cars of hay and feed were handled. This work aided in saving thousands of cattle from starvation.

SEED REPORTING SERVICE.

During the fiscal year ending June 30, 1919, six branch offices, at Chicago, Kansas City, Minneapolis, Spokane, San Francisco, and Atlanta, were maintained in connection with this service. Mr. W. A. Wheeler directed this work.

By means of informal inquiries sent to voluntary reporters, growers, shippers, and dealers, and by personal visits, information was obtained and transmitted to Washington, where much of it was assembled and worked into articles or reports for publication in the "Seed Reporter." The most important reports published may be classified as (1) outlook reports, including figures and descriptive matter concerning acreage, yield per acre, quality and prices of field seeds; (2) shipment reports, including stocks in shippers' hands, carry over in growers' hands, shipments during the last season, shipments during the current season, etc.; (3) seed market reports, including trade information—supply, demand, prices, movement, etc., at some of the most important seed-marketing points; and (4) vegetable seed crop condition reports, from the most important seed-producing sections. The publication of these reports made timely information available to the small grower, small shipper, and small

dealer which in the past has been in the possession of comparatively few of the largest seedsmen and commercial seed growers. Twelve issues of the "Seed Reporter" were published and mailed monthly to approximately 23,000 growers, shippers, dealers, and other interested persons.

In addition to the reports mentioned, the results of two national seed surveys were published. Besides stocks, receipts, and exports of field and vegetable seeds, these surveys covered sales of certain kinds of field seeds and acreage and production of vegetable seeds. Through the information obtained in these surveys, it has been possible to facilitate the movement of seeds from producer to consumer, and to reduce inflation in seed prices.

CITY MARKET REPORTING SERVICE.

The City Market Reporting Service was conducted during the last fiscal year with emergency funds, under the supervision of Mr. G. V. Branch, in order to furnish a market news service to farmers in the vicinity of large markets who require information of a different character from that furnished to distant carlot shippers, and to keep city consumers informed of market conditions in order that the consumption of abundant products might be facilitated to the advantage of both producers and consumers. Market reports of this sort were issued during the year from 16 offices: Baltimore, Md.; Boston, Mass.; Bridgeport, Conn.; Chicago, Ill.; Cleveland, Ohio; Denver, Colo.; Detroit, Mich.; Hartford and New Haven, Conn.; Philadelphia, Pa.; Providence, R. I.; St. Paul, Minn.; Springfield, Mass.; Waterbury, Conn.; Washington, D. C.; and Worcester, Mass. The offices in St. Louis, Mo., and Lawrence, Mass., where the service had been maintained during the preceding fiscal year, were closed because it was not possible to secure men properly equipped to carry on the work.

The work in the 16 cities named was continued along the lines followed in the preceding year. Reports for growers were enlarged and perfected and were issued each market day, about 30,000 farmers and 600 dealers being reached. The reports were distributed on the market and by mail and in some cases were published in local newspapers. Reports for consumers were furnished to newspapers which publish them regularly in most cases.

During the fiscal year active cooperation was maintained with local representatives of the Federal Food Administration in the publication of its fair-price lists. On account of the discontinuance of emergency funds this work was closed on June 30, 1919.

EMERGENCY TRAFFIC AND STORAGE ASSISTANCE.

In order to render special assistance during the war, transportation men were sent to heavy producing sections to work in close cooperation with shippers and carriers to avert shortages of cars and ice for refrigeration in transit; to secure heavier and better loading; to procure more efficient service for shippers, and to bring about the best possible utilization of equipment. Although this work was first undertaken during the war, it should be continued in peace times so far as funds are available. Mr. G. C. White directs all work of this character.

During the past year work of this kind was done in the Salt River Valley of Arizona, at Turlock, Calif., at Spokane for the entire Northwest, and at Brawley, Calif., for the Imperial Valley.

FOOD PRODUCTS INSPECTION SERVICE.

FRUITS AND VEGETABLES.

Food products inspection offices were maintained during the past fiscal year in an average of 30 important markets. The service was discontinued in four of the less important markets and new offices were opened in Columbus and Milwaukee. A total of 164 markets were designated as inspection points, most of these being served by inspectors stationed in the branch offices at the important central markets. About 15,000 inspections were made during the year. Mr. W. M. Scott and Mr. C. T. More supervised this work during the past fiscal year.

Amendments to the authority under which the inspection service is conducted, which became effective October 1, 1918, made the service available not only to shippers but to receivers, railroads, and other persons financially interested. Amendments also provided that a fee should be charged for each inspection.

Shippers in all parts of the country are using the service with increasing frequency, and receivers in the markets in which inspectors are located avail themselves of it very generally. The railroads also are making a more general use of its facilities, and in some markets try to secure an inspection certificate on each car or each lot of fruits and vegetables regarding the quality or condition of which there appears to be a question and a likelihood of a future claim. The heaviest demand for inspections has existed in the Eastern and Middle States.

During the first half of the fiscal year close cooperation was maintained with the United States Food Administration. Its Federal, State, and local administrators used the inspection certificates continually since they found them a necessary basis for adjusting a large number of claims between shippers and receivers. Work of a cooperative and advisory nature also was conducted with the Army and Navy, the inspectors occasionally visiting cantonments and other military posts in order to give advice to camp quartermasters regarding the grading, handling, and inspection of fruits and vegetables. In New York City several men were assigned to inspect supplies of fruits and vegetables for naval vessels and transports. This enabled the Navy Department to effect economies and to obtain supplies of fruits and vegetables of better quality with less waste than otherwise would have been possible.

That the inspection work has been very favorably received by all interests concerned is evidenced by the increasing use which shippers, receivers, and carriers are making of its facilities. Many requests have been received during the year from trade and commercial organizations for the establishment of the service in the cities which they represent, but it has been necessary to decline practically all of these requests because of limited funds.

The Bureau of Markets has had the fullest cooperation of specialists of the Bureau of Plant Industry, who are working to combat fruit and vegetable diseases. They have rendered especially valuable

assistance in training market inspectors to identify the more important diseases, and also in preparing valuable hand-colored books illustrating the effects of diseases on fruits and vegetables.

BUTTER.

The butter inspection service, which was instituted during the past year on a small scale, was supervised by Mr. R. C. Potts. Regulations covering the inspection of butter were published in Service and Regulatory Announcements No. 51. This service was conducted in New York, Philadelphia, Chicago, and Minneapolis.

STORAGE REPORTS.

For the greater part of the fiscal year 1919 this work was done under the direction of Mr. C. W. Thompson, assisted by Mr. John O. Bell. The storage reports issued by the Bureau of Markets show the reserve supply of some of the more perishable foodstuffs, and deal for the most part with holdings in cold storage. These reports cover seven classes of foodstuffs, namely, apples, butter, cheese, eggs, frozen and cured meats, frozen poultry, and frozen and cured fish. These classes are subdivided into 50 different items, including 5 kinds of frozen poultry, 7 varieties of cheese, and 25 varieties of fish.

For convenience in tabulating the returns the country is divided into eight geographical sections, as follows: New England, Middle Atlantic, South Atlantic, North Central East, North Central West, South Central, Western North, and Western South. Blank forms are furnished to the 1,400 cold-storage firms in the United States on which to submit their reports. The reports submitted to the Bureau come from the warehousemen and show quantities in storage, regardless of ownership. In addition to showing actual quantities of different commodities in storage on a specified date, certain comparisons are made with reports of other months in order to indicate the relative amount in storage, as compared with previous dates, and the increase or decrease in holdings during the month. Comparison of the holdings of the current month with the same month in the previous year is made for each geographic section, while comparison concerning the current and preceding month covers the whole United States.

PURCHASE AND DISTRIBUTION OF NITRATE OF SODA.

The purchase and sale of nitrate of soda to farmers was continued in 1919 under authority of section 27 of the food control act, with Mr. J. H. Collins acting directly in charge.

In 1918 nitrate was purchased in Chile and was sold to farmers at \$75.50 per ton of 2,000 pounds. One hundred and twenty thousand tons were purchased, but only 75,000 short tons were received in sufficient time to be distributed during the season of 1918 and about 40,000 tons remained on hand for sale in 1919.

The signing of the armistice and the sudden termination of the war left in the possession of the War Department a large quantity of nitrate which had been purchased and imported for use in manufacturing munitions. The Department of Agriculture arranged to secure about 115,000 tons of this nitrate at salvage rates, and announced a price of \$81 per short ton, f. o. b. shipping point or port.

The fact that the 40,000 tons carried over from 1918 were bought at a lower price and sold at \$81 per ton enabled this Department to sell the entire quantity of nitrate distributed during the past fiscal year at only a very slight advance over the War Department's salvage price.

Essentially the same plan of distribution was followed as in 1918. Orders were taken from about 100,000 farmers by county agricultural agents and committees appointed to assist them. As in 1918, nitrate was shipped to the county nitrate distributors on "order notify" bills of lading, with sight drafts attached. These county distributors collected from farmers purchasing the nitrate and also distributed the nitrate on arrival.

Distribution of nitrate to farmers in 38 States was made from 21 storage points. In all cases farmers were given the benefit of the most advantageous freight rates. The first shipments of nitrate went forward during the latter part of January and distribution was not completed until late in June. The bulk of the shipments went forward during the months of March and April.

The smallest application was for one-tenth of a ton; the largest individual application was for 300 tons. A total of nearly 153,000 tons was sold during the year. On the basis of retail prices as reported to the Department, the saving to farmers through the purchase of this nitrate exceeded \$2,000,000 this year.

All applicants received their full quota and practically all shipments went forward in ample time for use during the season.

On June 30, 1919, there remained on hand 1,718.8 short tons of nitrate for which application had not been received. Under the agreement of the purchase this is returnable to the War Department.

REGULATORY WORK.

ENFORCEMENT OF THE UNITED STATES COTTON FUTURES ACT.

The administrative work connected with the enforcement of the cotton futures act is under the general supervision of Mr. D. S. Murph. The enforcement of the act is carried out under the following projects:

INVESTIGATIONS OF FUTURE AND SPOT MARKETS.

These investigations are directed by Mr. George R. Argo. Securing accurate quotations for different grades of cotton, especially in the case of low grades, has been increasingly difficult during the past season owing to the wide divergence in prices in different sections of the cotton belt. Low-grade cotton has been quoted at the widest discount off Middling, the basis grade, ever known to the cotton trade. Quotations for Good Ordinary have been published by spot exchanges as low as 1,200 points off Middling, and doubtless cotton of this grade has sold at greater discounts at interior points. The possibility of the delivery of future contracts of cotton of this character at differences that were unduly narrow resulted in an abnormal disparity between spots and futures, but the readjustment was rapid as soon as quotations for differences were widened to the approximate selling value of low-grade cottons. Such widening also resulted in creating a broader market for low-grade cotton. Under an amendment to the cotton futures act, by the wheat price guaranty act of

March 4, 1919, authority has been granted the Secretary of Agriculture to require reports of purchases and sales of spot cotton in order to secure accurate quotations for the various grades. This information will be especially valuable to the producer when it relates to cotton below Low Middling on account of the untenderability on future exchange contracts of the low grades and the comparative lack of authentic information available to the producer as to their value. It is intended to publish all such information that will be of value to the public.

Representatives of the designated spot markets held a meeting in Memphis in April, 1919, to devise a uniform system of quotations by the spot exchanges. A tentative plan was adopted and submitted to the exchanges for ratification, effective August 1. It appears that substantially all the exchanges have agreed to adopt the plan.

DETERMINATION OF DISPUTES AND CLASSIFICATION OF COTTON FOR DELIVERY ON FUTURE CONTRACTS.

The number of disputes increased materially during the last fiscal year owing to the fact that a large quantity of low-grade cotton was delivered on future contracts. For 1919 a total of 493 disputes were received and passed upon as against 146 in 1918. The total number of bales of cotton involved was 29,303 as against 6,895 in 1918. The amount of money collected for determining the disputes was \$9,066.68 as against \$2,202.30 in 1918. This fund was covered into the Treasury of the United States in accordance with the provisions of the United States cotton futures act.

In accordance with an amendment to the United States cotton futures act by the wheat price guaranty act of March 4, 1919, all cotton to be delivered on future contracts is now classified by the Department of Agriculture, and no further disputes will be heard, except possibly on some old-style contracts outstanding that may be settled by delivery of cotton in fulfillment thereof. Very few old-style contracts, however, are outstanding, and the likelihood of further disputes is remote.

As the amendments to the cotton futures act became effective on March 4, 1919, the date of their enactment, there was some unavoidable delay and inconvenience both to the trade and the Government in the execution of their provisions. The delay in beginning actual classification of cotton at the New York and New Orleans Exchanges occasioned by the necessity for providing an organization and the time required for drafting regulations for this work, however, was not considerable, and only slight inconvenience was caused to the cotton trade with respect to deliveries of cotton on contracts entered into after March 4. Conferences were held with members of the two future exchanges, temporary regulations were adopted, and classification was begun at New Orleans on March 24. Classification for New York began on April 4. Approximately 30,000 bales were classed in New York during April and May for delivery on May contracts and the work was satisfactorily performed with no further delay to the trade. Final regulations governing the classification of cotton for future delivery under section 5 of the cotton futures act were adopted by the Secretary on May 20, 1919, and became effective immediately.

Cotton classed to June 30 in New York amounted to 37,354 bales; in New Orleans, 6,741 bales.

Owing to the congestion at the warehouses in New Orleans, delivery of spot cotton on future contracts has been considerably less than normal.

PREPARATION AND DISTRIBUTION OF OFFICIAL COTTON STANDARDS.

During the greater part of the fiscal year this work was supervised by Mr. Fred Taylor, and after his resignation by Mr. D. E. Earle.

Since the standards for grade of upland cotton were promulgated in 1914, and up to June 30, 1919, 1,145 full white and colored sets and 296 fractional colored sets were sold. On August 1, 1918, the price of each box of all grade standards was advanced from \$2.50 to \$5 on account of increased cost of labor, material, and transportation. Every important cotton exchange and spot market in the United States has adopted these standards and uses them as a basis of daily quotations.

Official cotton standards for American-Egyptian and Sea Island cottons and standards for length of staple were established and promulgated effective October 25, 1918. Thirty-four full sets and one fractional set of American-Egyptian grade standards, four full sets of American Sea Island standards, and 72 sets of the standards for length of staple have been sold to the trade since their promulgation. A method of pulling staple has been devised and recommended for adoption by the trade.

During the fiscal year ending June 30, 1919, \$37,840.71 was covered into the Treasury as miscellaneous receipts—\$31,987.71 from the sale of miscellaneous and rejected cotton and \$5,853 from the sale and revision of copies of the standards.

ENFORCEMENT OF THE UNITED STATES GRAIN STANDARDS ACT.

The enforcement of the United States grain standards act was carried out in its third year under the direction of Mr. George Livingston.

On July 15, 1918, the standards for both shelled corn and wheat were revised. The revision in the case of the corn standards was slight, while the changes in the wheat grades were greater. As a result of these changes the percentage of the 1918 crop of wheat which fell into the higher grades was considerably higher than the percentage of the 1917 crop so falling. Available data show also that a larger percentage of the 1917 crop, which was graded by the original standards, fell into the top grades than would have been true had former diverse State and local standards been applied. The fixed price for wheat, which was based upon the Federal grades, resulted in the use of these grades in practically all sales of wheat made throughout the United States during this period, and consequently close cooperation was maintained with the Grain Corporation of the Food Administration.

On June 16, 1919, the Federal standards for oats were made effective and seem to be giving general satisfaction. These standards had been discussed with producers, grain shippers, elevators, warehousemen, and other members of the trade prior to their publication

and public hearings also were held. The grades also were tried out experimentally for several weeks before they were finally put into effect.

As the result of conferences with representative members of the grain trade a committee was selected late in the fiscal year to investigate conditions at inspection points east of the Rocky Mountains. This committee was selected by the grain trade and was composed of representatives of the Grain Dealers' National Association, the National Council of Farmers' Cooperative Associations, the Council of Grain Exchanges, the Millers' National Federation, and the Car Service Section of the Railroad Administration. All phases of the work performed in enforcing the grain standards act were considered, and the report of the committee shows that the trade and most of the inspection departments consider the Federal standards satisfactory when uniform methods and equipment are used, and that where proper cooperation was maintained between the various agencies concerned the enforcement of the act was proceeding in an entirely satisfactory manner. The committee recommended that an amendment to the grain standards act should be made in order to permit the entertaining of appeals on the grading of intrastate shipments by licensed inspectors and that grain samplers should be licensed under the act in the same manner that inspectors are licensed.

It became evident at the beginning of the fiscal year that closer contact with the actual work of supervision, inspection, and grading was necessary, and in January a field headquarters office was established at Chicago, Ill., within one night's travel of most of the great grain markets of the country.

Chicago also was made the headquarters of the board established during the past fiscal year to review the grade determinations made in the 35 branch offices. Since its organization during the past fiscal year, this board has reviewed 3,837 samples submitted by the various supervision offices and considered appeals from shippers who were dissatisfied with the decisions made by supervisors on appeals from inspections by licensed inspectors. This board also has reviewed, analyzed, and tabulated its findings with regard to 1,500 samples of oats from various supervision offices, and has prepared 185 type trays showing the effect on oats of damage and heat damage, the various classes of oats, and the minimum color requirements for oat grades. These trays are used as guides in grading oats.

In order to supervise more intimately the work of inspectors and promote uniformity and efficiency in the inspection work, a total of 53,149 grain samples have been examined in the various branch offices during the past fiscal year.

Twenty-six demonstrations showing the methods of grading grain and the proper use of grain-grading apparatus were made at State and county fairs in Minnesota, Montana, Iowa, North Dakota, Texas, Ohio, Nebraska, Washington, and Kansas, and 17 demonstrations were made at meetings of grain dealers' associations in Ohio, Texas, Kansas, Kentucky, North Dakota, Arkansas, Iowa, Missouri, Illinois, Colorado, Minnesota, and Georgia. Thirteen grain-grading schools were conducted in cooperation with the agricultural colleges in Idaho, Ohio, Missouri, Iowa, Oregon, and Michigan. This work has been productive of highly beneficial results and has been well received by producers and the trade.

Investigations were made of 58 cases of apparent violations of section 4 of the grain standards act regarding shipment of grain without inspection. Four of these cases have been referred by the Solicitor of the Department to the Attorney General for prosecution and another is now being prepared for transmission. Twenty cases involving misgrading of grain under the provisions of section 5, covering representations of grade other than those shown on inspection certificates, have been investigated, and in three cases the findings of the Secretary of Agriculture have been published. Some shippers have voluntarily restored large sums of money to buyers where violations of the act have been brought to light. Thirteen cases, involving violations of section 7, owing to certifications by persons not holding licenses, have been investigated as well as 11 cases involving charges against licensed inspectors under the same section. One case involving violation of section 10 also has been investigated.

Questions involving certification of cargo shipments of grain on the Great Lakes and the use of private brands by large shippers and exporters have been investigated to determine whether violations of the act are involved.

During the year 446 licenses were issued, two licenses were revoked, and 125 examinations were held to determine the eligibility of persons desiring to secure licenses. Twenty applicants for licenses were found unqualified.

During the year 6,651 appeals were filed through the supervision offices. The grades assigned by the licensed inspectors were found to be correct in 3,295 cases, while 3,293 cases showed the inspector to be in error. Sixty-three appeals were dismissed.

Nine disputes, representing controversy as to the grade of grain shipped between noninspection points, were handled during the year.

ADMINISTRATION OF UNITED STATES WAREHOUSE ACT.

The administration of this act is under the supervision of Messrs. D. S. Murph and R. L. Nixon. Recent amendments which were contained in the appropriation bill for the current year should do much to popularize the act, and it is hoped that warehousemen will take out licenses in increasingly large numbers now that certain obstacles have been removed. The State of North Carolina recently has adopted a law providing for a State system of licensed warehouses, and close cooperation will be maintained between this Bureau and the State officials who direct this work.

Licenses have been issued to five cotton warehousemen and nine cotton weighers and classifiers during the fiscal year, and applications are on file from 28 additional warehousemen. As soon as the necessary bonds are supplied, licenses will be issued to these applicants.

Substantial reductions in the cost of insuring licensed warehouses have been secured from rating bureaus in the South.

Approval of forms of receipts to be used under the regulations has been secured from the Federal Farm Loan Board and steps have been taken to secure like approval from the Federal Reserve Board.

Proposed regulations for grain warehouses have been issued and public hearings have been held. These regulations are now being

prepared in final form and the Department will be ready to consider applications from grain warehousemen in the near future.

Regulations for tobacco and wool warehouses are in the course of preparation.

ENFORCEMENT OF THE STANDARD CONTAINER ACT.

During the past year the enforcement of the standard container act was supervised by Messrs. W. M. Scott and C. T. More, assisted by Mr. F. P. Downing.

On account of the cooperation of package manufacturers, the work connected with the enforcement of the United States container act has been largely educational and corrective, one prosecution only having been brought against a manufacturer for violation of this law. In this case the defendant pleaded guilty. Shippers, manufacturers, the wholesale trade, and retailers have expressed great satisfaction with the results of the operation of this legislation. It has served to remove some of the unnecessary differences in size of packages and simplifies the marketing problem to that extent. Manufacturing plants in all parts of the country have been visited and their products have been tested. During the past year particular attention has been given to the packages manufactured in the Rocky Mountain and Pacific Coast States.

SUPERVISION OF STOCKYARDS AND LIVE-STOCK DEALERS.

The supervision of licensees operating stockyards or dealing in or handling live stock in or in connection with stockyards, as authorized by the President's proclamation of June 18, 1918, is conducted by the Bureau of Markets under the direction of the Secretary of Agriculture. Mr. Louis D. Hall is directly in charge of this work. A total of 2,803 licenses were in effect at the end of the past fiscal year. General regulations governing licensees were issued July 26, 1918, as Circular No. 116 of the office of the Secretary of Agriculture. These regulations were supplemented on September 24, 1918, in accordance with a proclamation of the President dated September 6, 1918, which extended the authority to include the live-stock buying activities of packers and the handling of dead stock by rendering concerns.

A corps of market supervisors was organized as rapidly as practicable and stationed in 26 important live-stock markets. One hundred and twenty-one licensed stockyards were placed under the supervision of the officers at the 26 central markets in whose respective districts they were located.

Complaints regarding various alleged violations of the regulations have been heard and acted upon, and other specific matters requiring adjustment by the local supervisors have been considered. The following instances afford an illustration of the numerous and varied cases that have been dealt with. Adequate facilities and service have been provided at a number of poorly equipped stockyards; new scales, pens, chutes, and other equipment have been put in; the cleaning of dirty pens has been made obligatory; arrangements for loading, unloading, and moving stock through stockyards have been improved and additional yardmen have been employed; terminal railroads have been required to furnish faster service, thus eliminating a

large amount of delay and shrinkage; unsuitable feed has been rejected; more accurate checks on weights of feed have been provided, and feed charges have been reduced in some cases at the instance of the market supervisors.

The books of commission firms and stockyard companies at a number of the large markets were examined for the purpose of determining whether increased charges for handling live stock were justified under the regulations, and a number of public hearings on this subject were held. The examination of these books disclosed several instances of overcharges on feed accounts. One licensee made restitution through the Bureau of Markets of more than \$20,000 to his consignors in amounts ranging from a few cents to more than \$900. Action in several other cases is pending; these involve overcharges aggregating approximately \$40,000. One commission firm has been obliged to restore to consignors amounts aggregating over \$18,000 which it wrongfully withheld when remitting for sales, and its license has been surrendered. The license of a firm found guilty of stealing live stock has been revoked. Some of the live-stock exchanges have passed new rules forbidding certain practices which are contrary to the spirit of the regulations, such as the use by commission firms of "cripple buyers" as yardmen, and the giving of tips to stockyard employees for special privileges in yarding stock. Partiality in the assignment to commission men and traders of pens and weighing arrangements has been eliminated at some of the important markets.

Besides the numerous specific cases which have been dealt with, many irregular and injurious practices have been eliminated voluntarily by the companies concerned in order to comply with the regulations. The mere presence of the supervisors at the markets has had a salutary effect. Numerous testimonials have been received regarding the wholesome effect of this service and the improvement of business practices and conditions at the stockyards.

A comprehensive investigation of the market classification of live stock was made to assist in establishing uniform standards on which to base price quotations at the various markets. The investigation resulted in the adoption of a tentative classification for the guidance of the supervisors and reporters at licensed stockyards. Preliminary arrangements were effected for recording and reporting live-stock and meat shipments from some of the principal market centers.

REPORT OF THE CHIEF OF THE OFFICE OF FARM MANAGEMENT.

H. C. TAYLOR, *Chief.*

Reorganization of the Office of Farm Management in accordance with a plan determined upon in a conference on reorganization held early in the present calendar year has now progressed so far that work is being inaugurated along the new lines of investigation provided for in the revised outline of projects. The office enters the new fiscal year with the preliminary work in this regard well in hand.

Under the plan adopted, the field of research work covered by the office has been divided into seven sections, as follows:

1. Cost of production.
2. Farm organization.
3. Farm financial relations.
4. Farm labor.
5. Agricultural history and geography.
6. Land economics (including land ownership and tenancy).
7. Farm life studies.

Cost of production studies along the lines suggested by a committee appointed by the Secretary to make recommendations in this regard have begun under the direction of Mr. F. W. Peck. Mr. Peck is also directing, temporarily, the work in farm organization. Dr. L. C. Gray, in charge of land economics, has outlined a series of inquiries in land ownership and tenancy, land settlement and colonization, and land policies. Farm life studies have been inaugurated under the direction of Dr. C. J. Galpin. Of the remaining sections, Agricultural History and Geography is identical with the old section of History and Distribution of Farm Enterprises; that of Farm Financial Relations is being established by transfer of existing groups from the Bureau of Markets; and that of Farm Labor remains to be organized.

Owing to the fact that practically all the research work done during the past year was done under the old plan of organization, the following detailed report of progress, for the most part, is arranged according to the old classification.

COST OF PRODUCTION.

Eight hundred and sixty-five cotton-enterprise records, together with the necessary farm organization data, were obtained from cotton growers in four of the southern States during the months of May and June, 1919. These records were distributed as follows: 162 representing two districts in Texas; 269 from three areas in Alabama; 254 from three sections in Georgia; and 180 from two areas in South Carolina. This material embraces staple factors of cotton and will allow the estimations of cost by using current prices.

Cooperative costs of production studies of the tobacco crop were instituted in May with the Kentucky Experiment Station. This enterprise study entails the cooperation with 160 representative tobacco growers in which the tobacco enterprise is studied in detail and in relation to the entire farm business.

Arrangements are being made with a number of the States looking toward cost accounting investigations to begin with the new farm year of 1920. A cost of tractor operation and farm organization study was arranged with the Ohio Experiment Station, the work in the field to begin July 10.

Tentative plans have been laid for making studies in the cost of producing wheat and sugar beets, and for special investigations in live-stock economic problems.

FARM BUSINESS ANALYSIS STUDIES.

Studies of the business side of farming and of factors affecting the profitable organization of farms have made substantial progress

during the year. An additional year's work on continuing surveys of farms has been inaugurated in the following areas:

Seventh year of the study of farms in a representative area of the hill land drained by the Ohio River (Washington County, Ohio).

Sixth year of the study of farms in a representative area of general farming in the Corn Belt (Clinton County, Ind.).

Third year of the study of farms in a representative area of fruit and general farming in the Shenandoah Valley (Frederick County, Va.).

Second year of the study of farms in a representative area of truck farming in Florida.

Second year of the study of farms in a representative area of the citrus fruit industry in Florida.

Second year of the study of small farms in the vicinity of Columbus and Cleveland, Ohio, and Indianapolis, Ind.

In cooperation with the Wisconsin College of Agriculture, the sixth year of the study of farms in Dane County, Wis.

These studies show in more or less concrete fashion the profits in farming over a period of years in a given area or for a certain type of farming. They give light on the effect, not only of those factors over which the farmer exerts more or less control, but also something regarding the effect of many factors over which he has little or no control.

In connection with these studies the results of the five-year study in the hill-land section of the Ohio River have been published as Department Bulletin 716, "A Five-Year Farm Management Survey in Palmer Township, Washington County, Ohio, 1912-1916." Department Bulletin 694, "A Study of Farm Management Problems in Lena'wee County, Michigan," covering the results obtained in a typical dairy farming area in southern Michigan, was also issued during the year.

CROP ECONOMICS.

During the year material was collected in western New York with special reference to labor-saving devices in handling the apple crop. Supplementary data were also secured in connection with a survey which was made in the apple-growing districts of western New York about two years ago. This practically completes the list of reports relating to the cost factors in the production of apples under various conditions in the United States. No new work was started on apples during the year.

Progress was made in bringing to completion a part of the investigational work on hay. In 1918 records were taken in the alfalfa and Johnson grass districts of Alabama and Mississippi. Two descriptive bulletins, namely, Farmers' Bulletin 1009, entitled "Hay Stackers," and Farmers' Bulletin 1049, entitled "Baling Hay," were published during the year.

Prior to 1918 a large number of estimates were obtained from farmers on the production of corn silage, particularly with reference to the effect of the degree of maturity on yields, shrinkage and wastage in storage, and the relative costs of different methods of handling this crop. A careful analysis has been made of the information contained in these records and comprehensive reports have been prepared summarizing the results.

Two hundred and eighty-five sugar-beet enterprise records were obtained in the irrigated districts of Colorado during the summer of 1918. These records were concerned chiefly with the labor require-

ments of such crops as alfalfa, barley, wheat, oats, beans, corn, etc., which are grown in the beet-producing sections. Three publications on sugar beets were issued, namely, Department Bulletin 748, "Farm Practice in Growing Sugar Beets in Michigan and Ohio," Department Bulletin 760, "Farm Practice in Growing Sugar Beets in Three California Districts," and Farmers' Bulletin 1042, "Saving Man Labor in Sugar Beet Fields."

LIVE-STOCK ECONOMICS.

In the field of live-stock economics studies of the costs of growing and of fattening beef cattle, which covered a number of the large western ranches and selected areas in the corn-belt region, were undertaken in cooperation with the Federal Trade Commission, and the data obtained have been worked up and submitted to the commission.

Data are now being gathered on the cost of fattening beef cattle for the market. Cooperative relations have been established with the Bureau of Animal Industry, and financial cooperative relations have been arranged with Indiana and Illinois for the carrying on of this investigation.

FARM BOOKKEEPING AND COST ACCOUNTING.

Cooperative investigations in cost accounting on individual farms and studies of systems of bookkeeping and cost accounting in use by farmers and agricultural interests in general have been continued.

Work done in the field has consisted of visits to cooperating farmers for the purpose of making inventories, measuring crop areas, and securing other data necessary for the completion of records, and conferences with county agents and farmers seeking advice and assistance in farm accounting work. Current office work has included the posting, tabulating, and summarizing of cooperators' records, and the handling of a considerable mass of correspondence and personal inquiry from individuals interested in farm accounts or cost accounting.

In addition to routine work, a special study has been made in connection with the farm labor problem created by the war. In this connection, labor requirement data, by months, for each crop or other farm enterprise and for the farm as a whole, were tabulated for 69 farm years, covering representative farms in four agricultural regions.

TENANCY AND FARM-LABOR PROBLEMS.

On account of the urgent demand for practical work on the subject of farm labor, a part or all of the time of the men engaged on tenancy projects of the office was withdrawn from that subject and devoted to farm labor or some other related matters. On this account it was impossible to do much field work during the year. Material on the subject of renting land devoted to sugar beets, on stability of tenure of the farm operator, and on methods of renting farms in the wheat belt of the Central West was worked up. Some work was also done on data relating to the general subject of renting farms, the renting of land devoted to small grains, the renting of dairy farms, systems of renting by stock shares, and the rent rela-

tions existing between landlord and tenant on a New York farm. Additions were made to the large collection of leases in possession of the office, and the files of these were indexed to make them more readily available.

The farm-labor operations were conducted along the lines which were pursued during the previous fiscal year. Farm-help specialists were maintained in practically every State. These men worked in co-operation with the extension divisions of the agricultural colleges, particularly the county agents, and also with the State departments of agriculture, State departments of labor, and other State organizations concerned with the labor problem, and finally with the United States Employment Service and other employment offices. The farm-help specialists took an active part in organizing local farm-labor business.

Attention was chiefly devoted to the problem of making labor more efficient on the farms. This involved the encouragement of the cooperative exchange of labor among farmers, the study of wages as related to farm prices, the provision of better housing and living conditions for laborers, the use of gasoline power, labor-saving devices, and the development of a better spirit of cooperation between the farmer and the city business man in solving the annual problem of seasonal farm-labor requirements.

Active cooperation was also maintained with the War Department, particularly with the morale branch of the General Staff. In this work the office maintained representatives at 11 demobilization camps for the purpose of furnishing information regarding agricultural opportunities and particularly regarding openings for employment on farms to all returning soldiers who were interested in agriculture.

FARM EQUIPMENT.

The work done during the year with reference to farm equipment has been largely concerned with the use of power machinery and with the relations between mechanical power and horse power. Three new studies were made:

1. A study of the displacement of horses by tractors and the cost of operating tractors on about 200 corn-belt farms was made during the summer of 1918.
2. A preliminary economic study of the use of motor trucks on farms was made in sections around Kansas City, Omaha, and Indianapolis, with the intention of obtaining, as soon as possible, detailed information on motor-truck operations from a large number of farms in all parts of the country.
3. A study of the duty of farm implements and crews and the costs of using farm implements in central Illinois.

REPORT OF THE CHIEF OF THE WEATHER BUREAU.

G. F. MARVIN, *Chief of Bureau.*

POST-WAR CONDITIONS.

With the close of the fiscal year and the passing of war conditions the Weather Bureau finds itself face to face with post-war conditions of more serious character even than the difficulties imposed by the

war. It seems appropriate at this time to state briefly the status and functions of the Weather Bureau because applied meteorology ~~as~~ never before in history has come to be recognized as a highly important factor and guide in the conduct of almost every activity of any consequence of the Nation. Never before in any previous war did the science of meteorology play any important part or have a place in the program of military and naval organizations and operations. Now it is regarded as indispensable and is destined to become a permanent feature of each arm of the service.

Created in 1870 as a part of the Signal Corps of the United States Army by a joint resolution of Congress "to provide for taking meteorological observations at the military stations in the interior of the continent and at other points in the States and Territories of the United States and for giving notice on the northern lakes and on the seacoast, by magnetic telegraph and marine signals, of the approach and force of storms," its network of stations soon embraced the entire United States.

Subsequently the designation of the service was changed to the Weather Bureau, which, by act of Congress approved October 1, 1890, was transferred from the War Department to the Department of Agriculture and its duties and functions defined in the following language:

The Chief of the Weather Bureau, under the direction of the Secretary of Agriculture, shall have charge of forecasting the weather; the issue of storm warnings; the display of weather and flood signals for the benefit of agriculture, commerce, and navigation; the gaging and reporting of rivers; the maintenance and operation of seacoast telegraph lines and the collection and transmission of marine intelligence for the benefit of commerce and navigation; the reporting of temperature and rainfall conditions for the cotton interests; the display of frost, cold-wave, and other signals; the distribution of meteorological information in the interest of agriculture and commerce; and the taking of such meteorological observations as may be necessary to establish and record the climatic conditions of the United States, or are essential for the proper execution of the foregoing duties.

This organic act, with interpretations and extensions by subsequent annual appropriations, assigns to the Weather Bureau the entire domain of meteorology, including the duty of preparation and issue of forecasts and warnings of weather, storms, cold waves, heavy snows, floods, and the stages of rivers, all in the interest of commerce, agriculture, and navigation. At present it maintains over 200 fully equipped meteorological stations, and about 1,400 substations classified as special meteorological, river, storm-warning, hurricane, marine, cotton-region, corn-and-wheat-region, fruit, cranberry, and fire-weather warning stations. In addition to these the Bureau maintains, in connection with its climatological work, about 4,500 stations known as cooperative stations, the equipment being furnished by the Bureau and the observations being taken by public-spirited citizens who render gratuitous service. Its cooperative work extends to practically every ocean of the globe, and the masters of many vessels (the number was greatly reduced by the war, but is now on the increase) fill out our forms of daily meteorological observations on every voyage, to be forwarded on arrival in port. Before the war daily observations received by cable and otherwise from selected stations over the entire Northern Hemisphere were collected and published. Negotiations to restore this exchange are under way. A highly

trained, efficient, and experienced personnel of over 800 commissioned employees, helped by about 1,400 who receive a small compensation for the regular performance of specific duties, conducts the work of the Bureau, and in addition the marine and cooperative observers constitute a host of nearly 6,000 public-spirited individuals who serve gratuitously. Such, in brief, is the machinery and organization of the Weather Bureau.

While the Bureau is best known to the public through the issue of its daily forecasts, maps, and bulletins, there is no doubt that its greatest value in an economic sense consists in the immense saving effected by its special warnings, as of storms and hurricanes for the benefit of marine interests, warnings of floods that occur on the principal rivers, warnings of cold waves which accomplish protection to property and food stuffs liable to damage by injuriously low temperatures, and warnings of frost and freezing weather for the benefit of the fruit, sugar, tobacco, cranberry, market gardening, and other interests.

Its duties and authorities by law are broad and comprehensive, and post-war conditions bring it new and important obligations and responsibilities which it is fully alert to recognize and eager to discharge. With the experience and traditions of nearly 50 years to its credit, the Bureau is in a position to render practically every service of a meteorological nature which may be required of such an agency and at an economy of expenditure of public funds which can not be surpassed, or even equaled, by any new agency.

A few only of the post-war problems and demands in the administration of the affairs of the Weather Bureau will be mentioned here.

METEOROLOGY AND AERONAUTICS.

From a phenomenal development under the stimulus of war necessities the navigation of the air is rapidly extending to its civil and commercial or industrial stage. Flying in ignorance or disregard of meteorological conditions and warnings is at times suicidal and destructive of costly property. Even before flying increased so greatly within the United States the Weather Bureau inaugurated a service of flying forecasts, effective December 1, 1918, which is conducted in cooperation with the Chief Signal Officer of the Army and for the benefit at first of the Army training posts and the aerial mail service of the Post Office Department, and later destined to be extended to all flying in general. Much development work is needed to make this service the most effective possible, all of which may be accomplished, as flying develops, through existing agencies and channels of co-operation between the public and the branches of the Government concerned.

METEOROLOGY FOR MILITARY OPERATIONS.

Closely allied to meteorology for aeronautics, the experiences of the war have created a demand for a service to supply information for artillery, gas warfare, and other kinds of military operations, each in its way different. The influence of winds upon the flight of projectiles has long been recognized, but in the past methods of observing the actual motions of the free air in the various altitudes were little known and less used, consequently the allowance for wind in the older formulæ of the artillerists were largely academic or mere

approximations, whereas nowadays the ballistic wind is not a matter of guess or estimation, but of definite and direct observations by meteorologists employed for the purpose and using pilot-balloons or other aerial apparatus which meteorologists have developed and employed in the advancement of their own science.

On a peace-time basis these needs are being met by cooperative work and arrangements existing between the Chief of the Weather Bureau and the Chief Signal Officer of the Army, as a result of which a limited number of stations are maintained by the Army, while others constituting a useful coordination of points are established and maintained by the Weather Bureau. Observations at these stations consist chiefly of the flight of small rubber pilot-balloons. The results are used locally as required and telegraphed to the central office of the Weather Bureau for the use of the official forecasters in the issue of flying advices and other information.

MARINE METEOROLOGICAL OBSERVATIONS.

The submarine menace brought on with the war soon terminated the program of observations which merchant vessels plying the several oceans of the globe were long accustomed to furnish with the object of supplying data and information concerning the climate and meteorology of the oceans for publication as aids to navigation (marine) on the pilot charts of the Hydrographic Office. This service is being restored gradually, and its importance is enhanced on account of the policy of extending the merchant marine of the United States, and also extensive navigation of the air over the oceans, which the future is sure to see accomplished.

Details of the major activities and work of the Bureau follow:

FORECAST SERVICE.

The general forecast service continued in operation as in the past several years. This plan consists of: (a) The Supervising Forecaster at the central office, Washington, D. C., who has general charge of the forecast work of the Weather Bureau and regularly makes the day-to-day forecasts and special warnings for the Washington forecast district and warnings of storms and dangerous winds for the Great Lakes, the Atlantic and Gulf coasts, and the West Indian waters; (b) district forecasters at the Chicago, New Orleans, Denver, and San Francisco forecast district centers, who have to do with the preparation and dissemination of forecasts and warnings for their respective districts; (c) a district forecaster at San Juan, P. R., who has charge of the issue of forecasts and warnings for that part of the West Indies lying east of longitude 70° west; (d) a district forecaster at Juneau, Alaska, who issues daily forecasts for the Juneau district of southeastern Alaska throughout the year, and for the lower Tanana Valley during the period of low temperatures; and (e) local forecast officials located in many cities of importance who prepare forecasts of weather, temperature, and wind for their respective limited regions. The forecast districts with headquarters at San Juan and Juneau were organized during the fiscal year ended June 30, 1919; otherwise there was no change in the general plan of organization.

FORECAST OFFICIALS.

The officials assigned to forecast service are selected only after long preliminary training and through competitive tests that extend through one or more years. It is necessary that the officials engaged in this work have a fundamental training in the laws of atmospherics and also that they be temperamentally fitted for the work, which, at times, is extremely arduous and requires the constant attention of the one engaged therein. In addition to the officials that are actually engaged on this work, there are of the younger men of the Bureau approximately 40 who engage in what is termed "practice forecasting," fitting themselves to later become local forecasters and yet later, in the event of special aptitude and success, to become assistants to district forecasters. This system of training forecasters must necessarily rest in the Weather Bureau, for there is no outside institution of learning where one might perfect himself in the art of weather forecasting.

FORECASTS AND WARNINGS.

The forecasts that are regularly issued by the Bureau are adapted to the many varied demands for them. In general, they consist of the following:

(a) Day-to-day forecasts, for 36 to 48 hours in advance, of the general weather, temperature, and wind conditions for the various State units. These forecasts are issued twice each day, a. m. and p. m., at approximately 9:30 o'clock. The morning forecast is given general distribution through the display of weather and temperature flags, the telephone, printed cards and bulletins, and the afternoon press; the evening forecast is distributed mainly through the various press associations for appearance in the morning press.

(b) Weekly forecasts, that are issued Saturday of each week for larger areas than the day-to-day forecasts, and set forth the expected general conditions of the weather for that period in advance. These forecasts are disseminated largely through the press, but also through mailed cards and bulletins.

(c) Local forecasts, that are issued daily by the officials of the more important Weather Bureau stations for their respective regions. These include a statement as to the probable weather, temperature, and wind, and, during the winter months, the probable minimum temperature is made a part of the forecast.

(d) Shippers' forecasts, which are regularly made during the months when temperatures likely to be injurious to shipments of perishable goods and produce occur. These forecasts are prepared and issued by the local forecasters at many of the regular Weather Bureau stations.

(e) Special forecasts that are issued from time to time as occasion requires, and some of these are given special designations, as, for example: "Fire-weather warnings," for the forest regions of the West; "Orchard forecasts," for the guidance of spraying operations for insect pests and fungi, and of heating operations to prevent frost injury. Moreover, special forecasts are regularly issued for the cranberry industry of Massachusetts, New Jersey, and Wisconsin; and for various other industries that are partially or wholly dependent on accurate forecasts of weather and temperature changes.

(f) Day-to-day forecasts of the weather and winds along the trans-Atlantic steamship lanes eastward from the Atlantic ports to the Grand Banks of Newfoundland are issued for the guidance of vessel masters.

(g) Day-to-day wind and weather forecasts for the Atlantic and Gulf coasts are issued each day and transmitted to vessels at sea through naval radio. In addition to the forecast there is included in this daily message the prevailing weather and wind conditions at ports along the Atlantic and Gulf coasts and a statement as to the position of any atmospheric disturbance and its direction and speed of movement and intensity.

(h) Aviation forecasts are made regularly each day for the Post Office Department and the United States Army Air Service and the United States Naval Air Service. This service is conducted in a rather limited way as yet, but the general plan of the Weather Bureau aims to effect its development as rapidly as funds and the extension of aviation justify.

(i) Warnings are obviously issued only at specified times, but many of them are so important that when conditions arise which require their issue other lines of work give way in order that the warnings and advices may be placed before commercial and other organizations that may be benefited thereby. Warnings are issued for cold waves, heavy snows, gales, frosts, local storms, floods, winds dangerous to navigation on the Great Lakes, the oceans, the Gulf of Mexico, and the Caribbean Sea, and for hurricanes. There can be no question but that this service saves many lives, and that property to the value of millions of dollars has been protected and saved through the prompt issue of these warnings by the Weather Bureau.

FUTURE DEMANDS.

With the wider recognition now accorded applied meteorology, increased demands are being made for information and forecasts. Advices of various kinds and forecasts are already being supplied the Air Services of the Army and the Navy and the Post Office Department, and it seems altogether probable that the growing demands for information and forecasts of a meteorological character will soon make necessary a new branch of forecasting planned to care primarily for the interests of aerial navigation.

RECENT EXAMPLES.

During 1919 there were two notable cases of the importance of accurate meteorological information and forecasts in connection with aerial navigation. The one was that of the trans-Atlantic seaplane flight by the United States Navy in May, and the other that of the visit of the British dirigible, the R-34, to our country during July. In both these instances the fullest cooperation on the part of the Weather Bureau was requested by the United States Navy. Complete synoptic meteorological reports were placed at the disposal of the officials of the Navy, and in addition the forecaster on duty prepared and issued forecasts based on the 8 a. m. and 8 p. m. regular observations for the commanding officers of these operations.

THE TRANS-ATLANTIC SEAPLANE FLIGHT IN MAY, 1919.

The start of the trans-Atlantic seaplane flight (United States Navy) was made from Rockaway the morning of May 8, two of the planes, the NC-1 and NC-3, reaching their destination, Halifax, the afternoon of the same day. The NC-4 developed engine trouble and put into Chatham, Mass. The forecast issued the morning of the 8th was as follows: "Moderate northwest and west winds. Fair weather to-day. Friday; fresh north to east winds, cloudy weather with rain over southern half of course." The evening of the 9th the following forecast was made for the seaplanes between Halifax and Trepassey Bay, Newfoundland: "Weather favorable for flight Saturday. Gentle variable winds. Fair weather. Wind velocity less than 15 miles an hour." The morning of the 10th the forecast for the same course read: "Fair weather Halifax to Newfoundland. Gentle variable winds, except moderate west and northwest off south coast of Newfoundland." The flight from Halifax to Trepassey Bay was made on the 10th and the two seaplanes making it reached their destination the afternoon of the same day. In the meantime the seaplane NC-4, at Chatham, Mass., had made ready for a renewal of the flight to Halifax, but it was held there for several days because of adverse wind and weather conditions. On the evening of the 13th the following forecast was sent the commander of the seaplane NC-4 at Chatham, Mass.: "Conditions favorable for start from Chatham for Halifax Wednesday morning (the 14th). Moderate to fresh westerly winds and fair weather." The flight was made to Halifax on the 14th under favorable conditions, and from Halifax to Trepassey Bay on the 15th, the advices sent to the commander of the NC-4 assuring him of favorable wind and weather conditions. On the 15th (Thursday) the following forecast was sent to the commander of the seaplanes at Trepassey Bay, Newfoundland: "Wind and weather conditions over the course (Newfoundland to the Azores) will improve during Friday and Saturday. Wind will be west and fresh and possibly strong. Weather will be fair. Above based on incomplete reports from the ocean. Advise start by Friday night." On Friday the following forecast was sent: "Surface winds fresh and possibly strong west-southwest and upper winds fresh to strong west over course between Newfoundland and the Azores; some clouds, fair visibility, and rising pressure. Conditions favorable for start." The seaplanes left Trepassey Bay the afternoon of the same day for the Azores. The NC-4 reached the Azores the late forenoon of the following day, while the NC-1 and the NC-3 landed in the vicinity of the Azores, but were unable to rise from the water and resume their flights

THE VISIT OF THE BRITISH DIRIGIBLE, THE R-34, JULY, 1919.

The Weather Bureau was called on for detailed information and forecasts before, during, and after the visit of the R-34 to the United States in July, 1919. The first call for information and forecasts was from the R-34 by radio when she was in the vicinity of Newfoundland, and then and after, until she had reached midocean on her return to Great Britain, the latest meteorological information and forecasts were always at the disposal of the commander of this craft. The following letter, addressed to the Chief of the Weather Bureau,

was received from the Secretary of the Navy concerning the work of the Weather Bureau in connection with the visit of the R-34 to our country:

The work done by the Weather Bureau before, during, and after the visit of the British dirigible R-34 has been keenly appreciated by the Navy Department, and by the British officers connected with this flight. The reports were most reliable and the last report sent by Maj. Bowie on the evening of July 10, undoubtedly was the prime agent in the safe departing of the ship.

Also there was received the following letter from the British air attaché in appreciation of the work of the Weather Bureau in connection with the flight of the R-34:

Permit me to thank you, on behalf of the Air Ministry for the very distinguished part you played in the success which attended the visit of the R-34. It is claimed that meteorology is the handmaiden of aeronautics, but I think that does not show the science enough respect. At any rate, you, by your assiduous attention to, and reading of, the weather during the visit contributed more than a fair share to the success attained.

TROPICAL STORMS.

Only one tropical storm of sufficient importance to justify the display of hurricane warnings occurred during the year, namely, that of August 1-6, 1918. This storm moved northwestward across the Caribbean Sea and Gulf of Mexico, and struck the Louisiana coast about 30 miles east of the mouth of the Sabine River, moving thence inward about 80 miles to northwestern Louisiana, where it was dissipated. It passed over Lake Charles and Gerstner Field, La., developing considerable violence, the wind attaining a velocity of about 100 miles an hour. Thirty-four deaths were reported as being due to the storm and the number of persons injured as more than twice that number. The damage to property was roughly estimated at \$5,000,000. Hurricane warnings in advance of the storm were ordered for the Louisiana and Texas coasts from Galveston east.

SPECIAL METEOROLOGICAL STATIONS.

As an aid to the forecast service in Alaska arrangements were made for the establishment of three special meteorological stations at Atka, Akiak, and Noorvik, Alaska, to report twice daily by radio.

HIGHWAYS WEATHER SERVICE.

A new project, designated "Highways weather service," was formally authorized during the year. In the carrying out of this project certain central stations receive reports of the conditions of the roads in the surrounding region or over certain main highways, and publish the same on their bulletins and in the press. In cases where the stations are centers of a corn-and-wheat or cotton-region service the reports of road conditions are obtained by telegraph without additional expense by the addition of a word indicating the conditions of the road to the daily report from the substations. In other instances they are obtained by mail by means of franked postal cards furnished to persons who are willing to cooperate with the Bureau in this service. Projects were in operation during the past winter at some 15 stations in 11 States, but at all but four of these it was a winter service only and was discontinued in the spring, to be resumed the coming winter. Although still in a tentative stage the service has

great possibilities and is likely to be largely extended in the future. It has proved very popular where it has been in operation, the official in charge at one station stating that he has as many calls for road data during the day as for the weather forecasts.

RIVER AND FLOOD WARNINGS.

The flood service of the Weather Bureau functioned properly, not only as to the issue of timely notices of the coming of floods but also in the daily statement of river conditions throughout the country.

The floods of the year were largely local and much less severe than in many previous years.

During threatening conditions which obtained for a time along the Mississippi River from Keokuk, Iowa, southward to Louisiana, Mo., information was furnished that proved to be of great practical utility in the organized effort to strengthen the levees along that section of the stream.

In the drainage investigations of the department and in many private enterprises in connection with river improvements the river and flood service has contributed valuable information both to agricultural and commercial interests along the great rivers of the country.

INSPECTION OF RIVER STATIONS.

Owing to the unprecedented demand for engineers, it has not been possible to obtain from the outside persons having the necessary skill and experience to correct irregularities which invariably creep into the work of river-gaging stations unless the work is frequently inspected.

As a temporary expedient an employee of the Washington office was detailed for a part of his time to field work in connection with the installation and upkeep of river gages. It was not possible in this way, however, to care for more than the most pressing cases. A return to the prewar basis of having persons of engineering ability available at central points for service in keeping the system of river-gaging stations up to standard is urgently needed.

CHANGES IN DISTRICT CENTERS.

No new river districts were organized during the year, but the charge of the Kansas River was transferred from Kansas City, Mo., to Topeka, Kans., largely for administrative reasons.

SNOW SURVEYS IN HIGH ALTITUDES.

The activities of the Bureau in determining the depth and density of the snow cover of high altitudes in certain drainage basins of the West were naturally restricted to the most urgent and promising cases. These were the White Mountain region of Arizona draining into the Roosevelt Reservoir and on the headwaters of the Walker River of Nevada.

FORMULÆ FOR FLOOD FORECASTING.

Studies leading to the formulation of rules for forecasting floods almost wholly from the physical data of rainfall have been completed during the year for the Asheville (N. C.) district.

COOPERATION.

Progress was made on the following-named specific projects during the year:

1. The collection of rainfall measurements in the mountains of Los Angeles and San Bernardino Counties, Calif., in cooperation with the local county officials.

2. The Wagon Wheel Gap Experiment Station in cooperation with the Forest Service of the department. This important project has now run for eight years, and a mass of unique data has been collected to establish, if possible, hitherto unknown facts concerning the relations between weather conditions and stream discharge on forested watersheds. The experiment has reached its second stage, in which one of the two watersheds will be denuded of its forest and observations continued for a further period of years under the changed conditions. A detailed study of the data for the first stage of the experiment is far advanced, and the future observations are looked forward to with great interest.

STATIONS AND OBSERVATIONS.**NEW WEATHER BUREAU BUILDINGS.**

After considerable unavoidable delays due to war and unsettled business conditions, the new Weather Bureau observatory and telegraph office building at Cape Henry, Va., was completed and accepted under date of September 8, 1918. This station was fully equipped with steel towers and lanterns for storm warning displays, and a small electric light plant to provide illumination for displays, vessel-signaling, and office purposes has proved very satisfactory. The new building was erected on the Weather Bureau reservation comprising 15,000 square feet of ground on beach front at the foot of Forty-third Street, where the location is much more advantageous than that previously had for many years on the lighthouse reservation. The old building is retained for use of the assistant observers.

CHANGES AT REGULAR STATIONS.

Narragansett Pier, R. I., station discontinued August 17, 1918. Weather building and reservation placed in hands of a caretaker.

Buildings and reservation at Mount Weather, Va., also remain in possession of caretaker.

On October 1, 1918, the important meteorological city substation, Central Park, New York, in the Army Building, near Sixty-fifth Street, East, maintained continuously for about 50 years past under local supervision, was removed to, and installed in the remodeled Belvidere Tower building, near the Eighty-first Street, West, entrance to the Park, and re-equipped as a permanently established substation of the Bureau.

Completion of a Federal building at New Haven, Conn., in which accommodations were provided by the Treasury Department, enabled the Bureau to effect removal thereto February 15, 1919, and save rental heretofore paid for quarters in a private building.

Notwithstanding the general increase in rentals throughout the country during the last two or three years, it has been possible

to effect a considerable saving to the Government by reason of the 5-year renewal clause in leases whereby the Bureau was able to retain occupied quarters at prewar prices. Leases involving \$6,466 at the old rate, which now expire by limitation at seven stations where increase is demanded, required renewal at a total increased cost to the Bureau of \$1,556 for the next fiscal year, or about 24 per cent of the total amount paid for such rentals. One serious incident of exorbitant increase in rental compelled the Bureau reluctantly to move its station at Topeka, Kans., to quarters in a new rented building. The following statement shows the present status of Weather Bureau offices at field stations outside of Washington, (not including Narragansett Pier or Mount Weather):

Free quarters and accommodations:

In Observatory buildings, owned and controlled by the Weather Bureau.....	45
In State University buildings.....	5
In Federal buildings.....	72
Total free of rental.....	122
Rented buildings, etc., owned by individuals or corporations:	
In office buildings.....	80
In buildings with grounds, aerological and special meteorological stations.....	19
Total number rented buildings partly or wholly occupied.....	99
Total.....	221

TELEPHONE SERVICE.

In connection with its prompt and wide dissemination of storm warnings and general meteorological information, the Weather Bureau probably is the most extensive user of telephones of any branch of the Government, and at its more than 220 central field stations has direct wire connections with local telephone exchanges. An authorized allotment of about \$14,000 was made for this local telephone service for the fiscal year ended June 30, 1919, and the increased local rates promulgated in the Postmaster General's Order No. 2940, effective May 1, 1919, called for an almost complete readjustment, together with an added and wholly unexpected charge against our appropriations for 1918-19. For next fiscal year the total cost of this service is likely to reach \$17,000.

TELEGRAPH CONTRACTS.

For the prompt handling of meteorological reports and weather information over the greater part of the Northern Hemisphere the Weather Bureau has necessarily maintained for many years past formal annual contracts, arranged under special authority of law, with all of the more important telegraph, telephone, and submarine cable companies, including also wireless commercial companies, through cooperation with the Naval Communications Service. By order of the Postmaster General, dated June 7, 1919, Weather Bureau contracts for next fiscal year and during Federal control were made exempt from increase of rates, but this affects only contracts entered into by the central office at Washington. An opinion was also obtained that increased rates were not applicable for wire and battery service leased for maintenance of local recording river gages and similar self-registering equipment used by the Weather Bureau.

INVESTIGATIONS IN VOLCANOLOGY.

The act making appropriations for the Weather Bureau for the fiscal year ended June 30, 1919, contains authority for investigations in volcanology and appropriates \$10,000 therefor. Provision for this project was included in a supplemental estimate submitted to Congress for the fiscal year 1917, but was not allowed. The estimate was not repeated for the fiscal years 1918 and 1919, but was inserted on the initiative of Congress itself for the current fiscal year. The primary purpose of the appropriation is to conduct investigations in volcanology at Kilauea Volcano, on Hawaii Island, of the Hawaiian group, with the expectation that they may be extended later in Alaska and other places in the United States possessions where active volcanoes exist. The site of the volcano and extensive adjacent territory has recently been included in a national park.

Investigations have been conducted at Kilauea since 1912, first under the auspices of the Massachusetts Institute of Technology, and since 1913 by the Hawaiian Volcano Research Association, which is composed principally of prominent citizens of Honolulu.

The Weather Bureau took formal control of the work at Kilauea on February 15, 1919. Prof. Thomas A. Jaggar, jr., formerly of the Massachusetts Institute of Technology, who has been in charge of the investigations since their inception, has been appointed volcanologist and will continue in immediate charge.

The buildings, grounds, instruments, and equipment belonging to the Hawaiian Volcano Research Association were transferred to the control of the Weather Bureau under the terms of a long-time lease. Prof. Jaggar and his assistants will reside in the observatory buildings, and the major part of their work will be conducted at the Kilauea Volcano, although simultaneous studies of the activities of near-by volcanoes, especially Mauna Loa, will be made as far as practicable.

The program of work at present contemplates little more than the maintenance of the systematic observations of the volcano, with some possible extensions in the way of a seismic survey of the vicinity. No more than this can be undertaken with present funds, but as national affairs become more stabilized under peace-time conditions the opportunity offered here of conducting extensive investigations in the field of volcanology will no doubt be fully supported and important results secured.

AEROLOGICAL INVESTIGATIONS.

Free-air observations by means of kites were obtained throughout the year at Drexel, Nebr., and Ellendale, N. Dak. Installation of equipment was completed for similar work at Broken Arrow, Okla., Groesbeck, Tex., Leesburg, Ga., and Royal Center, Ind. Regular observations were begun at those stations before January 1, 1919. These observations, as well as those at Drexel and Ellendale, include daily kite flights and, whenever possible, continuous series of flights covering periods of 24 to 36 hours. The records have been reduced at the central office, and the results published in aerological supplements of the Monthly Weather Review. Moreover, brief summaries are telegraphed daily to the central office and other district forecast centers.

The pilot-balloon work that was organized and conducted during the war by the meteorological section of the Signal Corps at Broken

Arrow, Okla., Ellendale, N. Dak., Groesbeck, Tex., Leesburg, Ga., Royal Center, Ind., and Washington, D. C., was transferred to the Weather Bureau during the latter half of the year. Similar work has been organized at regular Weather Bureau stations at Ithaca, N. Y., Lansing, Mich., and Madison, Wis. Observations are made twice daily, and the indicated wind conditions at various heights are telegraphed to the central office for use in furnishing advices to the military, naval, and postal aviation services. The Weather Bureau observations are supplemented by similar reports from several military and naval air stations where work with pilot balloons is regularly conducted. All of the free-air records thus obtained are furnished to the central office for final reduction and study.

Both during and after the war there was close cooperation with the Army and Navy meteorological services. Special data were furnished also to the ordnance departments and to the military intelligence and aviation services. Advices were given to the United States Navy in connection with its trans-Atlantic flight project, further details of which are stated under the section on forecast service.

TELEGRAPH SERVICE.

The prompt collection and dissemination of weather reports and warnings require an extensive network and use of commercial telegraphic facilities. Various elements of a disturbing nature contributed generally, and in some phases in an aggravated form, to a continuance of the difficulties experienced during the preceding year in maintaining the telegraphic circuits at a high standard of efficiency, although some improvement was noted during the last half of the year. Chief among the causes were shortage of experienced operators in the commercial companies, necessary employment of untrained forces, substitution of machine for manual transmission of telegrams over trunk lines, the epidemic of influenza, abridgment of the hours of labor, late opening of telegraph offices at numerous small but important points, preventing dispatch of observations at usual times, and, latterly, the prevalence of minor strike conditions.

Effectual means were promptly taken by the commercial companies as a rule, however, to remedy unsatisfactory conditions upon presentation of complaints, and, on the whole, the telegraph service was performed as efficiently as could have been expected.

Changes in telephonic rates, effective January 21, and in telegraphic rates, effective April 1, imposed additional difficulties in examination and passage of accounts for service, necessitating a large volume of correspondence to effect proper adjustment.

A complete revision of forms showing distribution of forecast messages throughout the country, approximately 1,100 daily, was accomplished, resulting in much improved record lists.

During May and June a large number of telegrams was handled in connection with the trans-Atlantic flights in which the Weather Bureau cooperated with the Navy Department, additional telegraphic loops having been installed for the purpose. As this business was filed during the rush hours of the morning and evening, its handling, coupled with the other routine work, taxed the operating facilities to the utmost.

The services of another clerk-operator are much needed to properly handle the telegraphic and auditing work throughout the crop and hurricane seasons, and the need is much accentuated at times of increased work similar to the above. Should there be further increases of telegraphic work consequent upon the contemplated extensive cooperation with the Army and Navy, a corresponding enlargement of the telegraphic force will become imperative.

WORK IN CLIMATOLOGY.

No important changes occurred during the year in the work in climatology, and the several important lines were carried forward as usual, despite many general enlargements in most of the items making up the duties and some decrease in the clerical force available.

All material prepared for the several publications of the Bureau was submitted as per schedule and the final reports printed at the time designated. The weather data for the Monthly Weather Review, Annual Report of the Chief of Bureau, and the monthly and annual climatological reports for the several States were subjected to the usual careful scrutiny, and effort has been made to maintain the standard of accuracy heretofore required, although, as stated above, there has been a steadily increasing number of reports to be examined and a constant diminution of the effective working capacity of the clerical force.

COOPERATIVE REPORTS.

The work of the cooperative observers of the Bureau has been maintained in a highly satisfactory manner despite the additional duties imposed on the observing force by the unsettled world conditions and the lessened opportunities for such work in view of the shortage of labor in general.

More changes in the observing force were necessary than usual, owing to a large shifting from the usual lines of work to those pertaining to the war, but the continuity of the work was usually provided for and the records as a whole were remarkably complete, and continued improvement in practically all features of the work was noted.

INSPECTION OF STATIONS.

The policy of inspecting cooperative stations once in each three years, temporarily suspended during the early portion of the fiscal year just closed, was vigorously taken up toward the latter part and is being continued whenever feasible for officials to absent themselves from their stations. These visits of inspection impress the cooperative observers with an added sense of the importance of their work, establish a spirit of sympathetic cooperation, and encourage them to renewed effort in case they have become discouraged at the prospective amount of work without financial remuneration or an apparent lack of appreciation by the Bureau or the public of the value of the records they are at such pains to make.

During the year most cordial cooperation was maintained with other Government bureaus in collecting meteorological reports from points that would naturally be without representation but for the willingness of the officials to take up this special duty in addition to their regular lines of work.

OCEAN METEOROLOGY.

As was pointed out in previous reports, the work of the marine section was seriously interfered with by the war, the loss of reporting vessels and censorship restrictions together having the effect of greatly reducing the number of reports available for charting and study. So far as possible, however, the work of the section proceeds along the usual lines.

Upon the close of the war attention was centered upon a program for the restoration and extension of the marine work, and plans have been formulated which will result in a material advancement of our knowledge respecting meteorological conditions of the great ocean areas.

Progress in this direction is necessary to enable the Bureau to meet the increasing demands for information regarding weather conditions over the oceans resulting from the expansion of our merchant marine and commercial development associated therewith, as well as those arising from experiments in trans-oceanic flight.

MISCELLANEOUS ITEMS OF WORK.

The usual work incident to the receipt, examination and filing of the meteorological reports of the Bureau went forward as usual. The section publications were assembled and prepared for distribution and the sets of these intended for station files for the year 1918 were bound and distributed. The binding of the original records of the preceding year was accomplished as usual and all reports put in shape for permanent preservation. The tabular matter usually extracted from the original records has been entered in the books prepared for such data and all are as nearly up to date as it is practicable to keep them.

Many data on the temperatures of the country have been accumulated during the year, particularly with regard to the maximum and minimum values. Extensive compilations of the daily and weekly means of these factors for the 40-year period ending with 1918, have been obtained from the various stations. It is hoped opportunity will be afforded during the present year to properly analyze and interpret these data and present them to the public.

Near the close of the year steps were taken to present to the public in general, but particularly for the benefit of the engineering professions, through the press, more information on the daily state of the moisture in the atmosphere, and at this writing these data are being published for the three principal observations in practically all the leading papers in the country. At the same time a revision of the local station forms intended for public distribution was being considered by which similar data will be presented to the public in much greater detail than heretofore.

The extensive utilization of our accumulated records by nearly every class of our population has continued during the year, and the fact that practically every request for information has been promptly and fully met indicates the extensive character of the data we are collecting. The reputation of the Bureau for prompt service has been fully maintained, as indicated by the many acknowledgments of appreciation received for early and complete responses to requests for information.

AGRICULTURAL METEOROLOGY.

The activities under this section include the supervision of special services maintained in the interests of agriculture in the principal grain, cotton, sugar, rice, alfalfa seed, cranberry, tomato, tobacco, fruit, and potato-growing districts, as well as in the great grazing districts for the benefit of those interested in stock production; all maintained for the collection and dissemination of information relative to current weather conditions throughout the country, and their resulting effects upon the development of crops and the progress of agricultural operations.

In addition to the above, studies are conducted on the influence of weather on the development of crops, and the relation of weather and climate to agricultural activities and crop yields, including the supervision and distribution of forecasts of minimum temperatures during critical periods in districts where protective methods are extensively practiced. The fruit frost-work was very successful during the year, particularly in the Northwestern States, and gratifying progress was made during the year in studies of special mathematical methods of forecasting minimum temperatures that may be injurious to fruit.

Weather is a dominant factor in the success or failure of agricultural or horticultural operations, and special effort was made during the year to apply the information collected, through the vast organization of special and cooperative services of the Weather Bureau, to the important problem of food production in its various aspects.

SPECIAL SERVICES.

Few changes were made during the year in the special crop services maintained by the Bureau and described sufficiently in the last annual report. The cotton, corn, and wheat services were improved during the year by the inauguration of a new system of making observations whereby the minimum temperatures experienced during the preceding night were reported instead of the 24-hour minimum.

A new method of issuing reports weekly, instead of daily, in the cattle region service, has proved very satisfactory, and resulted in a material reduction of expense. There is an insistent public demand for the extension of this service over some important grazing districts not yet covered, which it is hoped to meet in the near future.

Special studies were made during the year in the development of a mathematical hygrometric formula to aid in making more accurate minimum temperature forecasts.

The special forecast and warning service was extended, with good results, in connection with spraying operations in some important fruit growing districts. So far as the depleted personnel of the bureau would permit, trained officials of the Weather Bureau were detailed to special field duty in fruit districts during critical periods for the purpose of giving advice as to the best time to conduct spraying operations. It is hoped that, when more normal conditions prevail, the Bureau may be in position to enlarge and improve this branch of its activity.

Cooperation.—By request of other departments of the Government, and for the use of the recent Peace Conference at Paris, the Weather Bureau prepared, during the fall and early winter, a general summary of the climate of Africa, with special attention to that of the

former German colonies. A vast amount of climatic data was compiled, and a number of charts were prepared showing graphically the annual and monthly distribution of precipitation and temperature over the continent, together with a discussion of its climatic characteristics.

The Weather Bureau continued its cooperation with other bureaus of the department in maintaining special meteorological stations at various points in different sections of the country as an aid to research and investigation of the many agricultural problems in which weather is an important factor.

INSTRUMENTATION.

The instrumental equipment of the various stations of the Bureau has been maintained at the high standard of former years. The practical cessation of European supply and the difficulties attending American manufacture of instruments have made it less simple than heretofore to obtain suitable supplies, particularly when such supplies involved the labor of highly skilled artisans. Prices of instruments and of parts have increased greatly, and we have been able to maintain the equipment of the Bureau with the appropriation available only by working over a considerable stock of apparatus available. The instrument shop of the Bureau has been availed of to salvage instruments that under ordinary conditions would hardly be worth repair. Naturally a time will soon come when further operations of this character will not be possible, and, unless prices recede, a substantial increase in the allotment for instrumental equipment must follow.

STORM-WARNING EQUIPMENT.

The three-lantern system was completed on the Atlantic coast during the fall of 1918, and work on the Pacific coast was about half completed at the end of the fiscal year. The entire installation will be finished by October 1, 1919. It is a pleasure to report that there has been very little expense for repairs at stations equipped with this new system, and while the initial expenditure of making the change is somewhat high, it is believed that the total cost to the Bureau through a period of, say, 10 years will be no greater than would be the cost of maintaining the former less effective equipment.

INVESTIGATIONS IN SOLAR RADIATION.

The necessity of employing untrained observers led to the suspension of radiation measurements at Santa Fe, N. Mex., between September 12, 1918, and April 23, 1919, and to a marked reduction in the number of measurements at Lincoln, Nebr., during July and August, 1918. By the end of April, 1919, measurements were being obtained as heretofore at both these stations, and also at Madison, Wis., and Washington, D. C.

The assignment of the official in charge of solar-radiation investigations to the editorship of the Monthly Weather Review greatly curtailed his opportunity for research work. However, apparatus was tested and an observer trained in its use for the measurement of nocturnal radiation in orchards at Pomona, Calif., and at Medford, Oreg., in connection with the frost-protection investigations of the Weather Bureau. Measurements were also made of the rate at which heat is radiated from different types of oil heaters employed in orchard heating.

At the end of the fiscal year the work of computing from the radiation measurements available the diurnal and annual variations in radiation intensity with geographical position in the United States, and those which depend principally upon latitude, altitude, and the vapor content of the atmosphere, was well advanced. One of the by-products of the computation has been the determination of the relation between radiation intensity, expressed as a percentage of clear-sky intensity, and the percentage of cloudiness and of the possible hours of sunshine, as observed by eye and recorded automatically, respectively, at most Weather Bureau stations. The results of the computation, which will be shown graphically, will soon be ready for publication.

From the relation between the sun's total, or heat radiation, and the luminous solar radiation, heretofore determined, charts and tables are also being prepared showing the intensity of direct solar illumination on a surface normal to the solar rays, on a horizontal surface, and on vertical surfaces in the plane of the meridian and the prime vertical, respectively, and also the intensity of diffuse sky illumination on a horizontal surface. The illumination data are furnished in response to repeated and urgent requests from illuminating engineers and architects, and must be considered preliminary in their character, as the investigation has disclosed the need of extensions in the observational work, especially on the Pacific and Gulf coasts and in the northern tier of States.

INVESTIGATIONS IN SEISMOLOGY.

The important work of collecting and publishing earthquake data, begun December 1, 1914, has been continued during the year. These data are of two kinds, noninstrumental reports of earthquakes felt and instrumental records, often of quakes imperceptible to the senses and even originating at a great distance. The noninstrumental reports are rendered by all the regular stations of the Bureau, nearly 200 in number, and also by nearly all the Bureau's 4,500 cooperative observers. The instrumental records published by the Bureau have been obtained in part by instruments owned and operated by the Bureau itself, one at Washington, D. C.; one at Northfield, Vt.; and one at Chicago, Ill., and partly through the cooperation of a number of additional stations distributed from Panama to Alaska and from the Hawaiian Islands to Porto Rico.

During the calendar year 1918, 127 separate earthquakes strong enough to be felt were reported from different parts of the continental United States. The great majority of these did no damage whatever; a few, however, were strong to severe. One of these, occurring on April 21, destroyed the business sections of Hemet and San Jacinto, in southern California. An equally severe quake occurred on May 28 in New Mexico, but did very little damage.

The chief earthquake damage in our outlying possessions occurred in Porto Rico on October 11 and 12. The records of this series of quakes obtained at Washington and Chicago were used by the commission especially delegated to study these disturbances.

In addition to the above regular work certain studies of meteorological phenomena have been made and several brief papers published.

ANNUAL REPORT OF THE SECRETARY OF COMMERCE.

DEPARTMENT OF COMMERCE.

OFFICE OF THE SECRETARY,

Washington, October 30, 1919.

To the PRESIDENT:

I have the honor to submit herewith my seventh annual report, covering the operations and condition of the Department during the fiscal year which ended June 30, 1919, and tracing in a general way its operations to October 1 of the present year.

Recommendations have hitherto been often made respecting the inadequate subsistence allowance for Department employees when traveling. Force is added to these by present prices. It has always been wrong to require Government officers when traveling to pay out of their own pockets part of the cost of the public work they do. The situation is worse to-day. This injustice can not be too speedily corrected, either by increasing the subsistence allowances or by authorizing some flexibility in the matter under the direction of the Secretary.

It has been heretofore pointed out that the Bureau of Standards may and does send its representatives to meetings and conventions at public expense. The law especially permits this. It does not, however, grant a like privilege to the representatives of the Coast and Geodetic Survey, the Bureau of Fisheries, the Bureau of the Census, and other services. The same obligation and usefulness exists as regards this matter in connection with the work of all services. There is no reason why one bureau should be preferred to others. The privilege should be extended to all alike.

Your attention is particularly asked to Appendix B, giving in detail the record of the efforts of the Bureau of Fisheries to introduce new foods, in connection with statements that have been made in Congress respecting this work. The successful work of

this service in developing the use of existing aquatic foods and in introducing new ones has been stopped because one part of its work was confused with another part which has no relation to the matter. It has been thought best, therefore, to make the whole record clear in this report.

American-Canadian Fisheries Conference.

The appointment of the American-Canadian Fisheries Conference and its general purpose were referred to in my annual report for last year (p. 7).

Some of the questions that came before the conference are as old as the American Republic, others are of comparatively recent origin; and they differ greatly in national and international importance. Some of the questions were satisfactorily disposed of by executive action of the two countries, some can be settled only by treaty and others by legislation, and at least one was left for fuller consideration at a more auspicious time.

During the course of the inquiries conducted, action was taken as follows in the settlement of pending questions, or as affecting the fishery relations of the two countries:

1. The Canadian Government, by order in council, prohibited net fishing in Lake Champlain and thus gave to fish in the Quebec portion of the lake the same protection that was already afforded in New York and Vermont.

2. The Canadian Government, by order in council, modified the provisions of the *modus vivendi* so as to accord fuller facilities to American fishing vessels using Canadian ports and harbors.

3. The United States Government, by order of the Department of Commerce, permitted Canadian fishing vessels (and the fishing vessels of other nations acting with the United States in the prosecution of the war) to enter United States ports from the fishing grounds and clear for the high seas, this authority, however, like that granted by the Canadian Government in extension of the *modus vivendi*, being a war measure.

4. The United States Government, by order of the Department of Commerce, removed discriminatory navigational regulations applying to Canadian fishing vessels passing through the territorial waters of Alaska to and from the fishing grounds on the high seas.

A treaty covering the subject of reciprocal port privileges for the fishing vessels of the United States and Canada is pending.

Legislation is before Congress to restrict the use of lobster well-smacks by citizens of the United States in waters off the Canadian coast when there is a close time on lobster fishing in Canada, but no affirmative action has been taken on the measure.

Recommendations have been made to the respective Governments in regard to the protection of the Pacific halibut and the protection of sturgeons, and action thereon is pending. The international protection of whales, which the conference regarded as deserving careful attention, was recommended for consideration at a later date.

The protection and rehabilitation of the sockeye salmon fisheries in the contiguous waters of the State of Washington and the Province of British Columbia, perhaps the most important subject considered by the conference, was covered by a comprehensive system of regulations recommended for the adoption of the two countries. A treaty covering this subject was signed by the representatives of Great Britain, Canada, and the United States on September 2, 1919.

Vessels of the Department's Marine Services.

The steamer *Surveyor*, the only vessel especially designed and constructed for the work of the Coast and Geodetic Survey, went into the Navy a month after completion. The ship returned to the Survey with the honor of having assisted in disabling, on May 17, 1918, the German submarine *U-39*, which sank the *Lusitania*. She is now at her post of duty in Alaska and there provides for the first time a vessel adequate to the vast and difficult work of surveying those dangerous waters, the scene of so many disastrous wrecks. The *Surveyor* alone, indeed, is not sufficient for the task of covering the 26,000 miles of coast to be surveyed in Alaska. She will be assisted by other vessels which the Navy has turned over for that purpose, namely, the *Sialia*, the *Natoma*, and the *Wenonah*. Even with this equipment, now for the first time available, it will be long years before the waters of Alaska will be so well charted that they can be traversed in all parts with confidence. Great as the development of Alaska has been, it has been held back, as every navigator of those waters knows, by the failure of the country heretofore to visualize the size of the task of surveying its shores. We have waited until a sad series of wrecks, with their accompanying losses of life and property, have shocked us into activity in work which should have been adequately undertaken decades ago.

For the first time launches designed and built for the special duty have been provided for the wire-drag work of this service, and with these and two others which the Navy Department turned over to us under your Executive order of May 24, 1919, we are now able to carry on this important work in Alaska with more effectiveness. It is strange that in order to do a great duty of peace we should have to depend upon supplies assembled for war. It does not reflect credit upon our judgment and foresight that this should be so, but it is well to be thankful for what we have without worrying as to the way in which it came. The fact is that the Coast and Geodetic Survey has some vessels for service and a few launches for wire-drag work and that if sufficient funds are provided for their use and for the necessary field and office forces and equipment, the service is in a position to give assurance to our commerce and navigation of safety in all our waters such as it never had before.

On July 1, 1919, the Navy Department returned to the Bureau of Lighthouses 47 lighthouse tenders and 4 light vessels, transferred to that department for war uses by your Executive order of April 11, 1917. This Service has also acquired two small vessels (*Cosmos* and *Poinsettia*) from the Navy Department and during the year built two small tenders (*Elm* and *Pine*). Six lighthouse vessels have recently been lost: Diamond Shoal Light Vessel No. 71 was sunk by enemy submarine on August 6, 1918; Cross Rip Light Vessel No. 6 was destroyed by the ice in February, 1918; while in the shipyard awaiting repairs necessitated by damages from ice, the 35 Foot Channel Light Vessel No. 45 was burned on March 3, 1918; Relief Light Vessel No. 51 was sunk on Cornfield Point light vessel station by Standard Oil Co.'s barge on April 24, 1919; the tender *Gardenia*, after 40 years of valuable service, was condemned on March 1, 1917, as was Bush Bluff Light Vessel No. 97 on October 23, 1918, after 43 years of service.

The commandant of the fifth naval district, in his formal letter of June 30, 1919, returning some vessels of the Lighthouse Service to this Department, says:

The district commandant wishes to use this opportunity to express his high appreciation of the cordial cooperation of the Lighthouse Service in the solution of many problems arising during the period when they were under Navy control. The Lighthouse Service has responded quickly and efficiently to every demand made upon them by the naval district. The services of the lighthouse vessels were of immense value in the laying of submarine-defense nets and, after the armistice, in removing those nets. This was a task which would hardly be possible of accomplishment without the assistance of the lighthouse vessels.

The Navy Department has also turned over to the Bureau of Fisheries four scout patrol boats, two of which will be used as patrol boats in southeastern Alaskan waters and two for fish-cultural work. Four vessels, loaned by this bureau to the Navy Department during the war, have been returned. The *Roosevelt* was condemned and sold in early July of this year. The bureau purchased the *Eider*, formerly a deep-sea halibut vessel, for use as a tender between the Pribilof Islands and Alaskan Peninsula.

The work of the motor-vessel fleet of the Bureau of Navigation has been greatly increased because of the admirable working arrangement made with the Treasury Department, whereby such boats enforce not only the navigation and motor-boat laws, but the internal-revenue tax laws also applying to motor vessels. By this arrangement the Department has furnished during the fiscal year the motor vessels *Kilkenny* and *Tarragon*, with their officers and crews, and the Internal Revenue Bureau of the Treasury Department supplied the sum of \$5,000 as a part contribution toward the cost of fuel for the vessels, and paid also the salary of one officer.

Late in the year the motor vessel *Dixie*, belonging to this service, was restored by the Navy, and in addition two other vessels the *Siwash* and *Psyche II*, were turned over by them, so that the service will have during the current fiscal year five good motor vessels. The record of the past year shows the same satisfactory results as in previous years, but the number of vessels was less because the *Dixie* was in the Navy.

The mitigated fines and taxes collected as a result more than paid for the service. The work done for the Treasury resulted in the collections of large sums that would otherwise have been lost to sight, and was fully satisfactory to the officers of that Department.

It is proposed in the next calendar year to station the *Siwash* to cover the coast from New York east, the *Kilkenny* to patrol from New York to Wilmington, N. C., including Delaware and Chesapeake Bays and North Carolina sounds, the *Tarragon* to cover South Carolina and Florida waters, the *Dixie* the Mississippi River and tributaries and the Gulf coast, and the *Psyche II* to be on the Great Lakes. Full operation of these vessels in these areas will be contingent upon the funds available for their use. It can not be, however, emphasized too often that the work done by these patrol boats in enforcing the navigation laws in connection

with vessels plying our rivers, bays, sounds, and the inland waters along our coasts insures safety to navigation both for large and small vessels, and collects taxes which otherwise would not be collected, in such a way as to cost the Nation nothing, because the penalties which are imposed for violations, together with the taxes gathered, more than cover the cost of the boats and their repairs, maintenance, and operation.

The Department had the following vessels in its marine service on October 1, 1919:

Service.	In operation.	Not in operation.	Being built.	Sold.	Bought.	Turned over by Navy.	Loaned to Navy.	Returned by Navy.	Total.
Coast and Geodetic Survey.....	15			1		5		5	15
Bureau of Navigation.....	2	2					1		5
Bureau of Lighthouses:									
Tenders.....	54	1				2	47	47	54
Vessels.....	63	2	2				4	23	63
Bureau of Fisheries..	9			1	1	4		5	
Total.....	143	5	2	2	1	11	52	60	137

^a One sunk.

This is exclusive of 2 vessels loaned to the Coast and Geodetic Survey by the Philippine Government and of 54 motor boats of all sizes operated by the Bureau of Fisheries, and a large number of launches used at the various stations of the Lighthouse Service.

Incidentally it is worth mentioning that the steamer *Surveyor*, being constructed with that in mind, was ready without a day's delay to enter the naval service. Her successors will be similarly designed and built. It should be the case that every vessel of every maritime service of the Government should be designed so that if needed for the national defense they would be ready without alteration to do their special part. Such is the definite plan of this Department in the vessels that it builds, and it takes no small pride in the contribution that its ships, small as they are, rendered the national cause.

Vessels Urgently Needed for the Bureau of Lighthouses.

In the operation of the Lighthouse Service, covering 47,300 miles of general coast line and rivers, there are at present employed 54 lighthouse tenders and 63 light vessels, 117 in all. To maintain

this number 2 tenders and 2 light vessels should be built each year, and recommendations and estimates submitted yearly have emphasized this fact.

Since 1910 the number of aids to navigation has increased from 11,660 to 16,075, a total increase of 4,415, or 38 per cent. This increase has added greatly to the work of the tenders, so that the present number has become inadequate to maintain the service as required in the interests of navigation. There has also been an unusual number of casualties to vessels recently, 6 vessels having been lost, or condemned, as before stated.

As a result of careful study of the matter, it has been found that within the next five years 18 light vessels and 10 tenders should be replaced, and funds should be provided now for 17 of these vessels most urgently needed.

On May 15, 1919, in a letter to the Speaker of the House of Representatives, request has been made for a provision authorizing the construction or purchasing and equipping lighthouse tenders and light vessels for the Lighthouse Service of \$5,000,000. (See Appendix A.)

Buildings.

The buildings occupied by the Department of Commerce are:

1. Commerce Building, Nineteenth Street and Pennsylvania Avenue NW.
2. Bureau of Fisheries Building, Sixth and B Streets SW., and new adjoining fishery products laboratory.
3. Coast and Geodetic Survey Building, New Jersey Avenue near B Street SW., directly opposite the House of Representatives Office Building, and new adjoining chart, instrument, and archives building.
4. The Bureau of Standards, Pierce Mill Road, near Connecticut Avenue, is housed in 13 principal buildings and 7 minor buildings, 5 of the latter being temporary structures.

The fishery products laboratory had its rise in the necessity of developing under war conditions, as rapidly and broadly as possible, additional food supplies. Funds for the building were provided from the appropriation for the national security and defense. This laboratory is unique and its operations are expected to have a great and beneficial effect upon the fish industries and upon the food supplies obtained from them.

The new building for the Coast and Geodetic Survey, for which provision was made from the fund for the national security and

defense, though long delayed in its construction by the difficulty of securing the necessary materials during the war and since its close, is completed and its equipment in place. It was none too soon to meet the vastly increased demands for charts and service arising from the great increase in our merchant marine. If it is considered that to this well-known growth there was added also during the war an immensely increased demand for charts for the Navy, it will be clear that this service was called upon for an enormous expansion of its work at a time when a very large portion of its staff was absent, serving either in the Army or Navy at home and abroad, and when most of its vessels were taken from their regular duties to do naval work. It was only by untiring efforts, with equipment not intended for any such emergency, that sufficient charts were ready for the vessels as they were wanted. Fortunately, the crisis was met by new equipment, procured from war funds, without which the situation would have been serious. The new Harris automatic press was put into operation on January 7, and immediately made possible the mechanical production of charts in sufficient numbers to meet the need. The service is now better equipped than at any time in its history for the rapid production of charts, so far as its mechanical appliances are concerned.

The new building for the first time provides fireproof protection for the valuable records of the Coast and Geodetic Survey, which cover a period of over 100 years and represent an actual cash outlay of many millions of dollars.

These two buildings, in common with several erected at the Bureau of Standards, though built during and for the war, were so designed as to be equally useful and effective in peace. Every dollar of their cost is an investment, and not an expense, and will be permanently productive.

Land for a new building was acquired for what was then the Department of Commerce and Labor under the act of May 30, 1908 (35 Stat., 545), and, by the act of June 25, 1910 (36 Stat., 698), the Secretary of the Treasury was directed to prepare designs and estimates for a fireproof building to occupy the new site. On March 3, 1913, the plans for the proposed building were approved by my predecessor. Since that time three bureaus of the former Department have been transferred to the Department of Labor; one has gone to the Federal Trade Commission; two of the present services were omitted from the plans. The new

building, when redesigned, should be made to accommodate the office, the lithographing establishment with its accessories, the drawing room, and the instrument shop of the Coast and Geodetic Survey, and the administrative offices, and, if practicable, the laboratory of the Bureau of Fisheries. When this is done the property on Capitol Hill, adjoining the Public Health Service, opposite the House Office Building and near the Capitol itself, now occupied by the Coast and Geodetic Survey, could be used for other Government purposes, and in like manner the buildings now occupied by the Bureau of Fisheries will become available for other uses. The new buildings erected in connection with these two services are so designed as to be useful in other connections.

Five of the eight services of the Department, as well as the divisions of the Secretary's Office, are housed in the Commerce Building. The normal growth of these services, which are the Bureaus of the Census, Foreign and Domestic Commerce, Navigation, Lighthouses, and the Steamboat-Inspection Service, will overcrowd the building before the new one can be constructed. During the present year it has been necessary to house the division of statistics of the Bureau of Foreign and Domestic Commerce in the building occupied by the Council of National Defense.

The annual rental of the Commerce Building is \$65,500. This is at the rate of \$0.358 per square foot, gross. The lease of the building was renewed on July 1, 1919, for five years. During the pendency of this new lease the proposed Commerce Building should be redesigned and constructed, so as to be occupied by or before the lease terminates. In addition we are now paying an annual rental of \$1,225 for 4,900 square feet of storage space.

The comments heretofore made respecting the unfitness of the buildings occupied by the Coast and Geodetic Survey and by the Bureau of Fisheries are renewed. Reference is made to pages 10 and 11 of my annual report for 1918 and pages 218 to 220 of my annual report for 1917.

Bureau of Standards—Industrial Laboratory Building.

The great demands placed upon the bureau by the Government's war program made it necessary, early in the year, to build a larger laboratory building to house the work along the lines of structural materials and industrial research and related subjects.

The building is four stories, including basement, and has a frontage of 351 feet and depth of 166 feet. The main wings are 62 feet wide and the extensions 105 feet, forming an E-shaped ground plan.

The entire center wing is of special construction to provide for large testing machines. The central part is open from basement to third floor, with galleries surrounding the open well at first and second floor levels. The central well will ultimately be occupied by large vertical testing machines and the galleries by smaller testing machines. The two vacant spaces included in the E form of building have one-story courts covered by concrete roofs, each lighted by three large skylights.

Directly north of this building, separated from it by a driveway, is the new, one-story kiln building, 50 by 350 feet, which houses in its basement the heating plant for these two buildings. The end walls are connected with the industrial laboratory building by a brick wall, which contains an open archway for a driveway, so that the two buildings are in effect one large unit.

In the west extension is housed the section on cement, concrete, and building stone. It is fully provided with all necessary equipment for carrying out the research studies in this line, as well as attending to the large demands for routine tests of cement and concrete. Space is also provided for chemical research in the manufacture of cement.

On the second floor are the laboratories and offices of the section on lime, magnesite, and gypsum, these branches being similar in character to the cement work.

Various portions of the building are occupied by the sections on clay products and optical glass. They occupy the entire west court, which is equipped with special grinding machinery. The several types of furnaces used in the study and manufacture of these products are installed in the kiln house.

The central extension and the surrounding space for three floors are occupied by the metals-testing section, which is fully equipped to handle all physical tests of metals and metal structures, etc. The basement of the east extension will house the large horizontal Emery machine. When the installation of these machines is completed, this will be the most complete materials-testing laboratory, with machines of the largest capacity, in the world.

The work in textiles, paper, leather, and rubber is housed in the east part of the building, equipped with a large chamber in which is maintained an atmosphere of constant humidity and constant

temperature and various types of machinery necessary for the manufacture and research work in these materials.

On the third floor, in the central section of the building, are the laboratories for the work on lubricating oils.

The east court houses a machine shop for repairing the testing machines, preparing test specimens, and making new apparatus as required by the various lines of research.

The bureau's photographic department has a complete laboratory in the center wing on the third floor and is equipped to handle a large range of photographic work, from blue printing to the making of moving pictures.

Space is also allotted for a museum and display room to exhibit the various products and specimens of work accomplished, for a general library of books and periodicals dealing with industrial subjects, and for a lunch room and kitchen required to serve meals to the employees of the building.

Bureau of Standards—New Dynamometer and Altitude Laboratory.

The temporary wooden buildings, in which the altitude and dynamometer laboratories have been housed for the last year and a half, have now been replaced by a permanent structure of brick and concrete. This building has a rectangular floor plan measuring 50 by 150 feet.

Bureau of Fisheries—Laboratory Aquarium.

I have twice called attention to the need of a laboratory aquarium for the Bureau of Fisheries. (See pp. 12-14 of my annual report for 1917, and p. 11 of my report for 1918.) The prevailing cost of food is a continued, forceful argument in favor of the erection of this building.

It is true, of course, that in those features common to aquaria, the institution would be a source of education as well as of general popular interest, as are all of the famous aquaria. This, while valuable, is, however, not the essential purpose on which stress should be laid. Most important is the use of the aquarium as a laboratory for selecting and developing fishes as food, for their definite cultivation as food-producing animals, for treating this whole side of the animal kingdom with the same study and care as regards its possible service to mankind as is given to breeding cattle and sheep as producers either of dairy products

or of meat and of wool and leather. It does not reflect special credit upon our intelligence that, while doing so much and so well upon certain phases of animal industry, we neglect, indeed leave entirely untouched, another phase of which we know only that great possibilities exist which we have not tried to develop.

Long ago the Bureau of Fisheries established the fact that an acre of water on the farm could be made as productive of food as an acre of land. We have agricultural colleges dealing with the land acre and a great Government department ably cooperating with them. The water acres of the world are more in extent than are those of the land, and we are blest as a Nation with possibilities for aquatic life along our coasts and in our Great Lakes and streams such as is given to no other people of the world, yet we have not a single such station as is proposed, wherein, at an investment less than many an agricultural college has cost, we may study an even greater extent of food-producing possibilities.

The experience of the Bureau of Fisheries has shown that he would be very rash who would put limits to what our water areas could do in supplying food of many kinds. To argue from the past in this matter is to argue from times of ignorance, for within the last five years many fishes have become objects of common food, of which men knew hardly at all, and this process in many respects is capable of what seems unlimited extension.

Whatever the cause of the high price of food, its effect should be to make men eagerly study how food can be made to cost less, and that is what is now proposed.

Housing for the Bureau of the Census.

The Bureau of the Census will be housed during the census period, which began on July 1, 1919, in building "D," at Four-and-a-half Street and Missouri Avenue. The offices of the Director, of the division of manufactures, and of those portions of the service which are not specifically engaged upon the decennial census remain in the Commerce Building. The other branches have already been transferred to the new quarters and the force therein is being rapidly enlarged to cope with the work of the coming census. A clerical force of about 4,000 maximum will be employed in Washington on this work, and a great deal of space will be required for the many machines that will be used in tabulating the results of the census, and for storage for the millions of sched-

ules containing the data gathered by the field force and the 300,000,000 or more cards which will be used in tabulating the population and agricultural statistics.

Cooperation by the Bureau of the Census With Other Services and Organizations.

The Bureau of the Census and the Bureau of Education, Department of the Interior, are cooperating in taking the census of Alaska for 1920. The schedules, blanks, and other supplies have already been sent and work will begin immediately.

A conference was held between the Director of the Census, the chief statistician for manufactures of that bureau, and members of the National Industrial Conference Board of Boston and the National Association of Manufacturers, in order to insure the inclusion in the manufactures schedules of such inquiries as will be helpful and beneficial to industry. Schedules satisfactory to the industries and the bureau are being prepared.

The Geological Survey and the Bureau of Mines are cooperating in the compilation of information relative to the census of mines and quarries, in order to prevent duplication of work.

Archives Building.

It is earnestly to be hoped that the archives building, a design for which was authorized by the public buildings act of March 4, 1913, may be promptly constructed. The Department of Commerce will need not less than 85,000 cubic feet of space therein, with such additional room as will provide for ready accession and constant use of the records of this Department, dating back to the beginnings of the Government.

Urgent Needs of the Department.

Among the urgent needs of the Department are:

1. The provision of vessels for the Lighthouse Service, to which reference is made on preceding pages and in Appendix A.
2. The provision of funds to continue the work of the Lighthouse Service throughout the current fiscal year. The funds thus far appropriated are not sufficient, in view of necessary official increases of wages in other services, to carry the work of the Service much beyond the opening of the coming calendar year.
3. A building at the Bureau of Standards for a suitable power plant as recommended in my last annual report (p. 14).

4. A laboratory aquarium for the Bureau of Fisheries, treated earlier in this report.

5. A Government-owned building to house all the services of the Department, as recommended previously in this report.

6. An additional Assistant Secretary of Commerce to assist in the administration and supervision of the greatly increased work of the Department.

7. Special attention is invited to the recommendation under the title Steamboat-Inspection Service that the supervising inspectors of that important bureau be placed under the classified civil service.

A number of the urgent needs of the Department mentioned in my last report have already been met. Among these are:

1. The enlargement of the funds and the organization of the Bureau of Foreign and Domestic Commerce and a small but insufficient provision for more commercial attachés. The matter of proper payment for their clerks is still untouched.

2. Through the transfer of five vessels from the Navy the more urgent needs of the Coast Survey in this connection have been for the present met, and by the transfer of launches from the Navy **the need** for wire-drag launches in the Coast Survey is partly **covered**.

Following a suggestion made upon the floor of the House of Representatives by the former chairman of the Committee on Appropriations, Hon. Swagar Sherley, an effort was made with your approval to secure two special surveying steamers, similar in type to the *Surveyor*, from the United States Shipping Board, Emergency Fleet Corporation. The former chairman of the Shipping Board cooperated actively in the matter. At this writing, however, the subject is held up pending the discussion of certain legal questions, and its outcome is uncertain. Meanwhile the two vessels are greatly needed for deep-sea surveying, which can not be carried on upon any sufficient or properly economical scale without them.

3. An additional clerical force has been provided for the field work of the Steamboat-Inspection Service. An additional appropriation provided by the deficiency bill now pending may relieve the difficult situation in which the Coast and Geodetic Survey found itself by reason of the inadequate pay and the insufficient number of its draftsmen.

4. Provision was duly made for the census of 1920 and for housing the force necessary for that work.

5. An assistant has been provided for the Secretary of Commerce.

In the above way five out of eight urgent needs of the Department mentioned in my last report on pages 13 and 14 have in some measure received care.

Use of Motion Pictures in Industry.

Developments during the year confirmed the opinion that motion pictures can be made an important factor in governmental foreign-trade promotion. Experimental work initiated and carried on in China by Commercial Attaché Julean Arnold has been so successful that it has been impossible to supply films enough to meet the demands. It is a significant fact that the Chinese are keenly interested in films showing quantity production in American industry.

There has, however, been no appropriation available for carrying on this work on a suitable scale. Such films as could be obtained without expense from interested and far-sighted firms were sent to Mr. Arnold, who got such distribution as he could through chambers of commerce and other bodies. The success attained in this way indicates what could be accomplished with sufficient funds to carry on the work on a broad scale in all promising fields.

The case for the motion picture as a means of promoting our foreign trade in foreign countries was presented at a special hearing on March 1, 1919, before the House Committee on Interstate and Foreign Commerce, when attention was called especially to the fact that the value of this means of trade promotion had been proved, and that other Governments were already using it.

Reference is made to House resolution 571, Sixty-fifth Congress, third session, and to the report of hearings on moving pictures as a means of commercial promotion.

Pacific Cable Situation.

Existing facilities for transmitting cable messages across the Pacific Ocean are far from sufficient to meet the commercial demand. Chambers of commerce, business houses, and various commercial organizations have presented constant complaints of injurious delays, requesting that some remedy be applied adequate to meet the very unfortunate situation that exists.

The delays vitally impair the effectiveness of our foreign trade and have obliged business houses to undertake unusual and expensive expedients in order to transact their business at all.

We are in this important respect at a serious disadvantage compared with other commercial nations. Prices are often quoted and options given subject to acceptance within a given time, but in many cases when replies accepting quotations were delivered promptly to the cable they did not arrive in time to complete the transaction. There have, from this and similar reasons, been heavy losses in American export and import trade.

The subject has been one of careful study and of keen interest. On July 3, 1919, a report representing the joint views of the Bureau of Standards, the Bureau of Foreign and Domestic Commerce, and the then existing Industrial Cooperation Service was submitted to the Senate in connection with Senate bill No. 1651.

It is earnestly to be hoped that steps may be taken which will provide another cable under American control to the Far East, for to-day the United States is at a disadvantage in doing business with the Orient as compared with other countries.

Appropriations and Expenditures.

The itemized statement of the disbursements from the contingent fund of the Department of Commerce and the appropriation for "General expenses, Bureau of Standards," for the fiscal year ended June 30, 1919, required to be submitted to Congress by section 193 of the Revised Statutes of the United States; the itemized statement of expenditures under all appropriations for propagation of food fishes during the fiscal year ended June 30, 1919, required by the act of Congress approved March 3, 1887 (24 Stat., 523); and a statement showing travel on official business by officers and employees (other than special agents, inspectors, and employees who, in the discharge of their regular duties, are required to travel constantly) from Washington to points outside of the District of Columbia during the fiscal year ended June 30, 1919, as required by the act of Congress approved May 22, 1908 (35 Stat., 244), will be transmitted to Congress in the usual form.

The table following shows the total amount of all appropriations for the various bureaus and services of the Department of Commerce for the fiscal year ended June 30, 1919

Bureau,	Legislative act.	Sundry civil act.	Deficiency act.	Special act.	National se- curity and defense.	Total.
Office of the Secretary....	\$327,540.00				\$205,000.00	\$532,540.00
Bureau of Lighthouses...	65,430.00	\$6,483,000.00	\$753,577.87	\$748,297.00	275,000.00	8,325,304.87
Bureau of the Census....	1,349,240.00		16.35		160,000.00	1,509,256.35
Bureau of Foreign and Domestic Commerce....	554,120.00				325,000.00	879,120.00
Steamboat-Inspection Service.....	712,740.00		143,934.17			856,674.17
Bureau of Navigation....	217,045.00			736.65	40,000.00	257,781.65
Bureau of Standards....	1,299,860.00	40,000.00	107,240.48	105,000.00	510,800.00	2,062,900.48
Bureau of Fisheries.....		1,130,940.00	10,439.60		160,000.00	1,301,379.60
Coast and Geodetic Sur- vey.....		1,364,960.00			47,104.56	1,412,064.56
Total.....	4,525,975.00	9,018,900.00	1,015,208.47	854,033.65	1,722,904.56	17,137,021.68
Increase of compensation.	648,802.37					648,802.37
Allotment for printing and binding.....		400,000.00				400,000.00
Grand total.....	5,174,777.37	9,418,900.00	1,015,208.47	854,033.65	1,722,904.56	18,185,824.05

The following statement shows the expenditures during the fiscal year ended June 30, 1919, on account of all appropriations under the control of the Department, giving the total amounts disbursed by the various disbursing officers of the Department, and miscellaneous receipts for the same period:

EXPENDITURES.

By the Disbursing Clerk, Department of Commerce, on account of salaries and expenses of the Office of the Secretary of Commerce, the Bureaus of Foreign and Domestic Commerce, Navigation, Standards, Fisheries, the Census, and Lighthouses, the office of the Supervising Inspector General, Steamboat-Inspection Service, salaries and expenses of the Steamboat-Inspection Service at large, and public works of the Lighthouse and Fisheries Services (shown in detail in the first of the foregoing tables of disbursements)....	\$8,165,930.99
By the authorized disbursing officers of the Lighthouse Service....	7,165,538.34
By the special disbursing agent, Coast and Geodetic Survey.....	1,116,206.02
By special disbursing agents, Bureau of Fisheries.....	51,195.61
By the commercial agents of the Department investigating trade conditions abroad, as special disbursing agents.....	322,308.58
By warrants drawn on the Treasurer of the United States to satisfy accounts settled by the Auditor for the State and Other Departments.....	170,748.88
Printing and binding.....	399,961.32
Total.....	17,391,889.74

MISCELLANEOUS RECEIPTS.

Coast and Geodetic Survey: Sale of charts, publications, old property, etc.....	\$24, 052. 10
Bureau of the Census: Sale of publications, etc.....	282. 00
Bureau of Fisheries:	
Sale of 18,223 sealskins.....	741, 197. 42
Sale of fox and other skins.....	67, 588. 33
Sale of seal bones.....	2, 752. 80
Sale of old property, etc.....	11, 615. 66
Bureau of Navigation:	
Tonnage tax.....	1, 265, 229. 23
Navigation fees.....	143, 492. 19
Navigation fines.....	162, 146. 50
From deceased passengers.....	460. 00
Bureau of Standards: Sale of old property, etc.....	12. 50
Steamboat-Inspection Service: Sale of old property, etc.....	31. 55
Bureau of Lighthouses: Sale of old property, rentals, etc.....	35, 372. 69
Office of the Secretary: Sale of old property, etc.....	1, 054. 58
Total.....	2, 455, 287. 55

In the last seven years the Department of Commerce has turned back unused into the Treasury the following amounts:

June 30, 1913.....	\$618, 970. 01	June 30, 1918.....	\$149, 009. 51
June 30, 1914.....	347, 162. 48	June 30, 1919.....	476, 045. 10
June 30, 1915.....	247, 482. 22		
June 30, 1916.....	227, 941. 92	Total.....	2, 244, 606. 51
June 30, 1917.....	177, 995. 27		

There is a general impression that money appropriated means money spent. Yet here is a total of \$2,244,606.51 which could have been expended for the purposes named, but was not. In business circles such action would be deemed commendable and would win confidence of financial authorities in the wisdom of the disbursing organization. The reverse is true, however, in the Government under the existing system. The inference is not drawn from such facts by appropriating committees that care has been used in expenditure and so something has been saved for the Government, but rather that the estimates were, in the first instance, extravagant and blameworthy. Almost the first question asked when considering estimates is what the unexpended balance was the previous year, and it is argued that if last year a considerable balance remained less is needed for the coming year. The very economy resulting in the balance saved is made the basis for mulcting a service on its necessary expenditures in the future.

This is here pointed out as one of the faults, minor but real, of the present system of appropriating funds for Government purposes which it may be hoped a modern budget system would

remove. When the writer was an officer of the City of New York a direct incentive to saving was provided by the city charter which permitted unexpended balances to be used under the authority of the board of estimate for other work. Under such a system an executive naturally saved all he could in order to do as much work as possible with what remained. Under the present Government system the temptation is direct to use as nearly as possible all of the appropriation lest one be mulcted in the coming year and have insufficient funds for necessary work.

Estimates for Fiscal Year Ending June 30, 1921.

The estimates for the fiscal year 1921 aggregate \$35,318,068.40, and exceed the appropriations for the fiscal year 1920, amounting to \$29,052,955, by \$6,265,113.40.

The estimates include an item for the Fourteenth Decennial Census amounting to \$6,215,000.

The estimate is submitted in this form in view of the fact that it is impossible to apportion, with any approach to accuracy, the cost of the work during the second year of the decennial census period.

As the legislative, executive, and judicial act, approved March 1, 1919, carries an appropriation of \$15,000,000 for Fourteenth Census work, this will make a total of \$21,215,000 required for the Fourteenth Decennial Census period.

The total amount requested in last year's estimate for the Fourteenth Census period was \$20,500,000, or \$715,000 less than the total amount now estimated. This is accounted for as follows:

Since the original estimate was prepared, provision for an additional inquiry, relating to encumbrances on homes, was inserted in the census bill by the Senate and was enacted into law. The inclusion of this inquiry will add approximately \$1,000,000 to the cost of the Fourteenth Census. An additional estimate of \$50,000 has been made necessary for the construction of a fireproof vault installation of freight elevators, the strengthening of floors, etc., at the temporary war building, which has been assigned to the bureau for the use of the Fourteenth Census force.

The original estimate of \$300,000 for rent of buildings in the District of Columbia, and \$35,000 for fuel contained in last year's estimates, have been eliminated on account of the assignment to this bureau of the temporary war building. The cost of heating

that building will be paid by the Office of the Superintendent of the State, War, and Navy Building.

These changes are equivalent to a net increase of \$715,000.

The estimates submitted by the Lighthouse Service show an increase over appropriations of \$9,329,338.40. They include items of public works approximating \$8,000,000, of which items amounting to \$1,500,000 have been heretofore authorized by Congress. Fourteen items amounting to \$6,375,750 have not yet been authorized, but are urgently needed for the Service.

The increase for the Bureau of Foreign and Domestic Commerce is \$747,910, of which \$117,410 is for salaries for additional employees in Washington to enable the bureau to keep abreast of the ever-increasing work and \$410,000 additional is needed for the field service in this country and abroad. Sixty-nine thousand dollars is required for the development of trade by motion pictures, and \$151,500 is asked for post allowances for men in foreign service, for transporting their families, and for bringing home the remains of such as may die abroad.

The Steamboat-Inspection Service submits estimates increasing the amount appropriated for 1920 by \$97,320, as the Service is being called on continually to do more work incident to the country's shipping program.

The increase for the Bureau of Navigation is \$174,204 to enable the bureau to take care of the ever-increasing shipping problems which by law are imposed on this bureau.

The war added many new investigations to the Bureau of Standards, the cost of which during the war was borne by other departments and the President's fund, and approximately \$2,000,000 additional is required to enable the bureau to pursue these investigations, which will result in great benefit to the Government and general public in peace times.

The Bureau of Fisheries asks \$637,880 additional, and the Coast and Geodetic Survey submits estimates which exceed the appropriations for 1920 by \$2,000,000, over \$1,000,000 of which is required for new vessels.

Increases of salaries for employees in the District of Columbia are not included in the recommendations of this Department because the matter is under consideration by the Joint Commission on Reclassification of Salaries, and request will be made in the Book of Estimates that appropriations for these salaries be adjusted in accordance with such recommendations of the commission as receive the approval of the Congress.

This Department desires that such recommendations for increased salaries as may be recommended by the Joint Commission on Reclassification of Salaries be considered in connection with the estimates of this Department.

Personnel.

The accompanying table shows, by bureaus, the number of permanent positions in the Department on July 1, 1919, and the increase or decrease in each bureau as compared with July 1, 1918. The figures do not include temporary appointments, nor do they include the following appointments or employments not made by the head of the Department: Persons engaged in rodding, chaining, recording, heliotroping, etc., in field parties of the Coast and Geodetic Survey; temporary employments in field operations of the Bureau of Fisheries; mechanics, skilled tradesmen, and laborers employed in field construction work in the Lighthouse Service. Enlisted men on vessels of the Coast Survey in the Philippine Islands and officers and men of the Navy Department employed on vessels of the Bureau of Fisheries are also excluded. The total of these excluded miscellaneous employments and enlistments is approximately 5,000, as compared with 4,444 for the fiscal year 1918. At the close of the fiscal year 1919 there were 1,262 employees in the service of the Department serving under temporary appointment or employment.

The total number of permanent positions referred to in the accompanying table, together with the employments and enlistments just mentioned, on July 1, 1919, was approximately 12,340, as compared with 11,051 on July 1, 1918.

Superannuation and Retirement.

The annual reports of this Department during the past six years have presented the subject of retirement of superannuated and disabled Government employees. Hence it may hardly be necessary to add further expression of my views; yet I regard the subject as of such importance that I must not leave undone anything within my power to advance it. I look at it from the standpoint of common justice, on the one hand, and from that of efficient service, on the other hand. Large private concerns recognize that a lifetime spent in their service carries with it an obligation of honor toward the employee who has thus served faithfully when years make him incapable of further effective work. The business house that would turn out an aged employee,

saying to him in substance "Now look out for yourself" after a long and good record would be damned by the common opinion of the business world, and deservedly so. The only conceivable excuse that could be made would be that the employer had paid during the long service a sufficient salary over and above all the exigencies of life to have enabled the employee to provide himself for his own old age. No one will charge the Government with doing that. Failure to be as just in these matters as private concerns are, injures the Government either by causing the ambitious to seek better opportunities elsewhere or by relaxing the efforts of its employees generally through the unconscious drag that comes from hopeless service. The result of the present condition is seen in the survival of many old people in the Government work who struggle on because they needs must, when they should have ceased from their labors. Enactments requiring these aged workers to be discharged are substantially repealed by the higher law of humanity. They are demoted and maintained at reduced pay, thus creating what is in substance a pension without retirement, without the dignity of a recognition by the Government of their worth, and maintaining the inefficiency which everyone seeks to remove.

I am not especially concerned as to the details of any measure that may ameliorate this evil. During the present Congress many bills have been introduced for this purpose, one, the Lehlbach-Sterling bill, has passed the House of Representatives and has been introduced into the Senate. It may, perhaps, be susceptible of improvement, but it is a recognition of a claim and an attempt to remove an incubus on the wheels of governmental business. It is to be hoped that the bill may shortly become law, and thus at once justly provide for those who have served many years, open the door to more rapid promotion and to larger opportunities for younger and more active employees, and make the Government work more efficient not only through the removal of ineffectives, but by the unconscious but very real self-discipline that comes in response to wise and far-seeing treatment of the employee. I firmly believe that after a year of experience with any sound retirement system no voices will be lifted against it.

Salaries.

The Department has followed its usual practice of filling vacancies by promoting the clerks in the service instead of filling the

higher-salaried positions with appointees from the civil-service registers without experience in Government work. It has been shown by experience to be a wise course, for it gives to every clerical employee assurance that faithful attendance to duty will bring about promotion in due time. It has developed, however, that many of the \$900 positions can not be filled permanently, as that entrance salary, even including the bonus of \$240 allowed during the present year, possesses no attraction as compared with the compensation offered by private employers. Competent clerks could be secured before the war at an entrance salary of \$900. They can not be had now. The positions that are thus vacant are needed for the work of the Government. The inability to fill them reduces the force, already insufficient, and imposes an undue strain upon employees in the higher grades whose duties are already heavy.

The present \$900 entrance salary for clerks should be abolished. Even with the bonus it is not sufficient to secure experienced clerks, notably stenographers and typewriters, who can readily obtain from \$1,200 to \$1,500 per annum elsewhere. There is a chronic dearth of this class of eligibles on the registers of the Civil Service Commission. The entrance compensation for clerks should be at least \$1,200 per annum, which is not more than is paid in many places for common labor.

The Nolan minimum compensation bill now before Congress is an attempt to minimize the hardship involved in the combination of low salary and high cost of living in cases where it bears most heavily. It is, however, but a partial solution of the problem. It is hoped that systematic and adequate relief in this respect will be accomplished through the work of the congressional Joint Commission on Reclassification of Salaries established under the act of March 1, 1919.

The Department has cooperated actively with the Joint Commission on Reclassification of Salaries and hopes that the studies of that commission will result in an improvement of existing conditions. The plain fact is that many of the Government workers are to-day unable to live, even with the severest economy, upon the pay which they receive. They are forced to run into debt, are obliged to seek separate means of adding to their income, or are forced to withdraw from the service because other employers are more appreciative than the Government of existing conditions.

The legislative, executive, and judicial appropriation act approved March 1, 1919, provides \$240 per annum increase of compensation for the fiscal year 1920, in lieu of the \$120 bonus allowed during the past fiscal year, in recognition of the necessity under present living conditions for upward revision of salaries. This but partially meets current necessities. The temporary increase is not comparable with the increase in the cost of living.

If, to the high prices of all necessary articles required for living, there be added the demands for subscriptions to Government loans, to the Red Cross, calls for the purchase of War Savings Stamps, and other outlays which, however fine, useful, or even thrifty, still call for payment from a fixed sum of amounts which are large in proportion thereto—if, let it be repeated, these demands are aggregated and against them is weighed the fact that during one fiscal year a bonus of but \$120 was added and in a second year a bonus of \$240, it must be evident not only that these bonuses are hopelessly inadequate to meet the situation, but that the net result of the pressure upon many faithful and hard-working people has been really tragic. It is astonishing how generous the working force of this Department has been in matters of public helpfulness when the conditions of life have been so hard.

There have, furthermore, been cases where real injustice has been done. In the Lighthouse Service the salaries of keepers have been raised by the act of Congress approved June 20, 1918. In the same Service the wages of seamen and officers on board vessels have also been raised, following the official action of the Navy Department and the Shipping Board. This, however, has left the field supervising and clerical force where they were before the war, save for the bonus. The result has been an actual discrimination against a portion of a service quite as worthy as those who have been more favored. Yet the requests made of Congress for funds sufficient to remove this act of real injustice have been refused. Under date of August 14, 1919, the superintendent of the eighteenth lighthouse district (San Francisco, Calif.) wrote the Commissioner of Lighthouses as follows:

The base pay of \$960 per annum with a bonus of \$240 per annum is practically the lowest paid by any Government service in this city, and only the poorer class of eligibles will accept an appointment in this district. It is feared that with this low base pay a class of clerks far below the average in efficiency will enter the Lighthouse Service and in the course of time prove a very serious handicap to the handling of the district work.

Indeed the funds allotted for the Lighthouse Service in all respects, whether as to keepers' salaries, the wages of seamen and officers on vessels, or the wages of its field supervising and clerical force, are far from sufficient to carry that Service through the fiscal year, and a very considerable sum will be necessary unless the work of that Service is to be actually shut off in large part before the year closes.

During the last two years the Bureau of Standards has lost nearly or quite 50 per cent of its technical staff. This applies to all grades of trained scientific and technical men, but is especially true of the leaders in specific lines. The salaries of these men in the laboratories of the industries or in consultation work are usually double those which the Bureau of Standards is permitted to pay. To make this entirely clear a table is given below in which the names are represented by letters, stating actual cases of experts who have left the service for other salaries and giving the salaries paid elsewhere:

Name.	Title at Bureau.	Bureau salary.	Salary outside.	Title outside.
A.....	Chief of paper section.....	\$2,700	\$7,200	Director of department of technical control of the largest paper concern in the country.
B.....	Senior associate physicist in metallurgical division.	3,300	5,000	Research metallurgist in large metal corporation.
C.....	Electrical engineer.....	3,300	4,500 and promise.	Electrical engineer.
D.....	Chief of textile section.....	2,500	About double.	Consulting textile expert.
E.....	Associate physicist, in charge paper laboratory.	2,500	Nearly double.	Head of research utilization and new developments in a large paper concern operating 12 mills.
F.....	Chief, magnetic laboratory....	2,500	Two or three times more. ^a	Consulting expert.
G.....	Gas engineer.....	2,520	3,300	Gas engineer in large gas corporation.

^a Refused outside offer of \$7,500.

The following table gives cases in which private firms have offered the technical experts of the Bureau of Standards higher salaries than those they are receiving. In some of these cases the experts were asked by outside employers to name their own price, yet they have remained at the Bureau of Standards at a personal sacrifice, which it is wholly unfair as well as unwise to ask them longer to continue.

Name.	Title at Bureau.	Bureau salary.	Salary outside.	Title outside.
H.....	Chief, division of ceramics and optical glass.	\$4,800	\$10,000	Ceramics chief.
I.....	Physicist and chief of the metallurgical division.	4,000	7,500	Scientific metallurgist in charge of American end of large metal corporation.
J.....	Optical-glass expert.....	2,500	5,000	Technical expert in optical-glass factory.
K.....	Associate physicist and metallographist.	2,700	4,000	Metallographist in aluminum corporation.
L.....	Chief, gage section.....	3,000	^a 5,000	Chief of gage manufacture in large industrial concern.

^a Contract arranges for increase; base salary is guaranteed.

The above examples are chosen from the higher grades, but facts in the same proportion exist in all grades of the scientific and technical staff. If this process is to continue, many lines of the bureau's investigational work will have to be abandoned. The best we can hope to do at the low salaries now provided is to maintain a few untrained men for routine and testing work, and even this will suffer for lack of proper supervision.

The Bureau of Standards has more than 100 specialized lines of scientific and technical work. Each demands an expert of experience and ability, able to plan and supervise research and testing of a superior grade. The bureau can not pay the salaries demanded by men who are already trained and have the requisite administrative experience, since there are but 30 positions in the grades from \$3,000 to \$3,500 per annum, inclusive.

A critical situation, therefore, arises, since, even when the bureau trains competent men and fits them to become chiefs of sections, the industries pick them off as fast as they become thoroughly competent. The reason is solely the low salaries the bureau is able to pay and (even at such salaries) the relatively small number of good positions compared with the number of specialized fields in the bureau. The case becomes even more serious when it is remembered that the Bureau of Standards is expected to be the leader in each of these specialized fields of scientific and technical work.

At least 10 Government boards and commissions have chiefs who receive in excess of that paid at the Bureau of Standards. The salaries of such chiefs range from \$7,500 to \$12,000 for training and experience not more highly technical or exacting than that required for the Bureau of Standards. The highest technical salary (apart from Director) at the Bureau of Standards is \$4,800.

The following partial list shows Government positions paying in excess of the bureau's maximum:

Federal Trade Commission:		Pan American Union:	
5 commissioners.....	\$10,000	Director general.....	\$7,500

The above table shows that 19 positions outside of the Bureau of Standards pay double the maximum expert salary. Salaries of \$10,000 and over per annum are not at all unusual with large industrial corporations for experts carrying on scientific and technical work; yet these men thus paid are those who consult the experts of the Bureau of Standards and are assisted by them.

It would be interesting to compare the salaries paid in the Railroad Administration not only with those given members of the Cabinet, but those paid the heads of country-wide services employing thousands of men and large equipment. It is a plain truth that on the whole the insufficiency of Government salaries in the higher, responsible positions approaches the scandalous.

By the act of Congress approved July 2, 1918, the pay of the inspectors of the Steamboat-Inspection Service was materially increased. The increase was, however, not as great as it should have been, nor proportionate with the increase received by men in outside employment doing the same kind of work.

The clerks in the Steamboat-Inspection Service should also receive an increase in pay. The work of the field clerks of the

Steamboat-Inspection Service is of a peculiar nature. It is well known that the maritime law is entirely different from the common law, and that the rules and procedure in admiralty are entirely different from the other procedure, and in the same way the organization of the Steamboat-Inspection Service is peculiar to itself. No other bureau in the Government has as many unusual and peculiar conditions to meet as the Steamboat-Inspection Service. The clerks must, therefore, be especially trained for the work they have to do before they are in any way efficient. The expansion in shipping has been tremendous, and incident thereto an enormous increase in the amount of work of that service. This work has been done without a murmur, and, as the inspectors have been rewarded, so should the clerks be.

The salaries for the vast majority of the classified positions in the Bureau of Fisheries have remained virtually stationary for about 30 years.

There is a large loss of effectiveness because of the grossly inadequate salaries paid throughout the service, but especially in the technical grades. It is unfair and demoralizing to employees qualified in fish culture, biology, and fishery technique to receive on the average much lower compensation than is given to unskilled laborers in private business.

The bureau has 13 clerical positions at \$900 each, and only 22 of higher grades, with salaries ranging from \$1,000 to \$1,800. The service is overcrowded at the bottom, and there is little opportunity for advancing capable and deserving employees. From July 1, 1917, to July 1, 1919, there have been 16 resignations in the \$900 grade because better pay could be obtained elsewhere. The present condition is very serious, due to the difficulty of obtaining and retaining intelligent employees with ability and initiative. The time of chiefs of division is occupied to such an extent by routine work that should be handled by subordinates that they have altogether too little opportunity for the important administrative matters of their divisions.

A readjustment of salaries in the field force attached to hatcheries is imperative. The present rate of pay was established more than a quarter of a century ago. The bureau for several years has been unable to induce desirable and qualified persons to enter this service at the meager compensation offered. The statutory base pay for apprentice fish-culturists is from \$600 in the United States proper to \$900 in Alaska; \$900 to \$1,200 for

fish-culturists and foremen; and \$1,500 for station superintendents. The latter officials are responsible for Government property valued at thousands of dollars and for the efficient operations of their respective hatcheries where important fish-cultural operations are carried on. The lowest base compensation for the grades mentioned should be \$900, \$1,200, and \$2,000, respectively.

It must be remembered that the Bureau of Fisheries requires a force especially equipped for its work. All of its employees must be trained for the business, and before receiving permanent appointments must pass a suitable civil-service examination.

The wage problem in the vessel service is a similar one. The positions of assistants in charge of divisions require men with long, technical training and experience and are now filled by highly qualified persons whose work is most effective and meets with the hearty support of the fishery interests and the general public. The present salaries attached to these positions are materially under those for corresponding positions or similar service in other bureaus of the Government. In 12 bureaus of 3 departments, excluding the Bureau of Fisheries, the average salary paid to a division chief or for similar positions is \$3,473, while in the latter Bureau it is \$2,600.

The bureau is now faced with the serious problem of preventing the inevitable deterioration of the service if it is to be composed of only those who can find no other employment, those who have independent means, or of those who will voluntarily forego the privileges and responsibilities of family life or condemn their children to the deprivation of many ordinary comforts and the opportunities for special education.

I invite attention to the nature, extent, diversity, and amount of the work performed by the Commissioner, Deputy Commissioner, chief clerk, and chief of tonnage division of the Bureau of Navigation in the hope that these officers may be paid properly. All these officers are men who by long training and experience are especially qualified for the work. The increase recommended is not based entirely on the work of this bureau during the past four years, which was increased rather than diminished by the multiplication of marine agencies and the scattering of marine work among them during the war. Although most of the statutory work of the Bureau of Navigation continued to be performed during this period, much of its time and efforts were required to

assist other branches of the Government, hurriedly organized, and in consequence not conversant with all the subjects with which they had to deal or with the acts of Congress governing those subjects and not to be ignored.

My recommendation is based on the elementary principle that the laborer is worthy of his hire. The Bureau of Navigation since 1884 by statute has general superintendence of the commercial marine and merchant seamen. This general jurisdiction of late years has been extended by the addition of new specific duties developed by inventions and progress such as the administration of laws relating to wireless apparatus and operators, motor-boat legislation, and other services specially provided for. The essential fact, however, is that we now have a merchant fleet in tonnage alone almost double the commercial fleet of 1914. Of more consequence, however, than the amount of tonnage is the fact that we now have in foreign trade alone a tonnage equal to that of our entire merchant fleet in 1914. During the current year this fleet will probably be increased by nearly 4,000,000 gross tons. In the foreign trade our ships must conform in many respects to the laws of the countries they visit, and the whole range of duties involved in Government supervision over and cooperation with merchant shipping is thus extended and made difficult by comparison with the simpler duties the Government assumes in the regulation of the domestic or coasting trade. My own observation accords with the views of practical shipping men and shipbuilders that the great increase in our fleets and their radius of commercial activity, due partly to the stimulation of the early years of the war, partly to the great appropriations by Congress after we entered the war, call for a better-paid and increased force to deal with shipping matters. With the concurrence of the Bureau of Navigation the necessary steps to remedy this condition were held in abeyance during the war, and since the end of the war nothing has been done in this connection.

The Commissioner of Navigation is probably the country's leading expert in the law, customs, and practice of the maritime profession. His long service of over a quarter of a century has given him peculiar familiarity with our national maritime laws. He is personally acquainted with the leading maritime officers, private and public, of other nations, and his counsel is by them sought and respected. It is a pitiful thing that such an officer should have to serve for a salary as small as \$4,000 per annum.

This is the smallest salary paid any bureau chief in the Department of Commerce and less than is paid in other positions of inferior authority.

The work of the Deputy Commissioner requires not only a knowledge of the application of the many laws administered by the bureau, but also judicial sense in the consideration annually of about 7,000 applications for the mitigation or remission of penalties in which he takes the preliminary action and makes recommendations. Direct administrative supervision of the various services of the bureau in the field requires also good business sense and promptitude. The Deputy Commissioner has amply demonstrated to my own satisfaction, and, I am confident, to the satisfaction of those who have dealings with this office, the possession of those qualities.

Through long experience the chief clerk has an intimate acquaintance with all phases of the bureau's work and with its relations to other branches of the service both here and in the field which it is hard to assess in money terms. I know of very few others who do so much work on which general reliance for accuracy must be placed who receive pay so incommensurate with the work.

The record and statistical work of this bureau in charge of the head of the tonnage division of only eight clerks is accepted as authority both here and abroad, and during the past four years, when attention has been focused on shipping, the work and forecasts of the chief of this division has stood all tests of criticism.

The salaries provided for the executive officers of the Bureau of Foreign and Domestic Commerce are entirely inadequate for the class of men demanded and the services performed. Increases should be provided, at least, for the Director, the two Assistant Directors, and the chief clerk. It is recommended that the salary of the Director be raised to \$8,000, of the First Assistant Director to \$4,500, and of the Second Assistant Director to \$4,000, and that the chief clerk be made an administrative assistant at \$3,500.

A number of new positions should be provided in order to carry on the more important work of the bureau, as well as in the clerical grades. Requests have, therefore, been made for one additional chief of section at \$2,500, one at \$2,250, and four at \$2,000 each, and an increase of six assistant chiefs of divisions at \$2,250. Recommendations for 1 additional clerk at \$1,800, 14 at \$1,600, 2 at \$1,400, and 56 at \$1,200 are also submitted.

In arriving at the estimate for increases in the statutory force, the Bureau of Foreign and Domestic Commerce believes that the force recommended is the absolute minimum if it is to distribute to the public properly and promptly the mass of material furnished by its field employees, as well as by the consular officers throughout the world.

As a result of the funds appropriated by Congress to meet the increased cost of living abroad, the Bureau of Foreign and Domestic Commerce was able to grant post allowances (which were urgently needed) to the commercial attachés and their secretaries. Even with these increases in income, three of the attachés resigned during the year to accept more remunerative positions in private employ. It has been impossible at many posts to obtain or retain capable secretaries because of the low salary limit imposed by law and the exceptionally high cost of living abroad.

The question of obtaining living salaries for the employees of the Coast and Geodetic Survey is a vital one. This bureau was organized in 1816; and is the oldest scientific arm of the Federal Government. At its beginning the entire field force consisted of the Superintendent at a salary of \$6,000 per annum and the two or three engineers under him, and necessarily the work, though most important, was comparatively limited in extent. To-day the field extends over and around the entire United States possessions, and the field and office force are commensurately greater and the labor far more arduous. The only element that has not largely increased is the recompense of the officers and men. Beginning with the Superintendent, his salary 103 years ago was \$6,000 and still remains the same. The hydrographic and geodetic engineers, while receiving slight increases during the past five years, should have years ago been paid salaries as large as those paid officers in the Army and Navy performing similar services.

Nearly 20 per cent of the commissioned officers of this service have resigned during the period January 1 to October 1, 1919. These officers give in every case as a reason the fact that they can not live on the wages which the Government pays. As this is written, there is published a statement respecting the officers and men of the Navy to the effect that hundreds of naval officers are resigning because of insufficient pay, and an increase is said to be sought in the officers' pay of 30 per cent and in the pay of seamen of 50 per cent over the present rate. It is earnestly

hoped these increased recompenses may be permitted, and that the bill providing for this increase may be amended to include the commissioned personnel of the Coast and Geodetic Survey, as requested by me in a letter dated October 1, 1919, to the Speaker of the House of Representatives.

Further, the bureau has need for many more computers than are now authorized, and the entrance and lower-grade salaries should be made higher. There are portfolios of field observations containing thousands of triangulation and precise leveling observations in the archives of the bureau that have never been computed. Indeed, so inadequate is the computing force of the bureau to meet the present needs, that the expedient has been adopted of putting into print the results from the latest field work and gradually working backward into the old material. If this were not done, the work would be very many years old before it would be put into print. As it is, the public is deprived of the benefits of this information that has cost many years of labor and many thousands of dollars. The cost of the computation and printing would be but a fractional part of the expenditures that have already been made. The publications of the bureau containing triangulation and precise-level data are issued in a form that is neither satisfactory nor economical. They met conditions that existed years ago. In order to issue the publications, in the form now most useful—that is, so that each of the State publications would contain all the data available at the time the publication was issued—would require additional computations in the Washington office of the Survey.

The instrument makers of the Survey are trained along the lines of a physicist and mechanical engineer, yet these experts, who make the most delicate instruments in the world, are in some cases paid no higher salaries than a fair clerk, and in no case as high a salary as he would receive in the Navy or Shipping Board.

One of the most conspicuous evidences of injustice is the marked discrimination against the clerks. Of the number called “clerks” in the Survey nearly half are specialists and have technical knowledge that is of the greatest value to the Government; yet the plea to have them properly designated and given just and fair salaries has thus far gone unnoticed. The request to no longer carry the \$720 statutory places has been heard, but this is only a beginning, and until it is realized further in the shape of tangible action, the service must continue to suffer by resignations and inability to fill the places except with incompetent persons. There

are but 43 clerks in the Survey, and during the past fiscal year 66 clerks left that service.

The bureau's valuable and highly trained copper engravers have been for years without salary increases, and now their righteous dissatisfaction is evident, and unless action is taken in their behalf the service will permanently suffer.

And so on down to the messengers and laborers. A man with ambition will not work for \$1.50 or \$2 per diem when he can earn \$3 somewhere else in the Government service. This bureau has had to hire boys to do men's work, who on account of age and education are totally unfit to fill the positions, and with such conditions even boys will not stay long.

Transportation of Families and Effects of Officers and Employees.

It has been very difficult in the past, owing to the small salaries we are able to pay, to secure properly qualified men to take charge of our commercial-attaché offices abroad and to conduct special investigations in the various foreign countries. One of the greatest drawbacks has been the fact that in nearly every case the men selected desire to take their families abroad, especially when they are to remain abroad for an extended period. They also often wish to take at least some household equipment. Under the present scale of salaries we are denied the services of many highly qualified men owing to their financial inability to take with them their families and effects. To meet this situation I am recommending that Congress allow \$50,000 to pay the actual and necessary expenses for transporting families and effects of officers of this Department who are sent abroad on official business. It hardly seems proper to require these men to pay, out of their own pocket and from a small salary, expenses necessitated by Government business, and which would not be otherwise incurred.

Transporting Remains of Officers and Employees Dying Abroad.

Under present conditions, if deaths occur in our force abroad the family of the deceased would have to assume the care and expense of having the remains returned to this country. This occurs at a time when it is possible the financial affairs of the deceased are in such condition that the family would be considerably embarrassed. The State Department has a fund to provide for such expenses, and I earnestly recommend that provision be made to remove this weakness in our provision for foreign service. An estimate has been submitted to Congress covering this matter.

Printing and Binding.

The Department's allotment of the appropriation for printing and binding for the fiscal year ended June 30, 1919, was \$400,000. In addition, the allotment was credited to the extent of \$23.47 for miscellaneous blank forms furnished by the Coast and Geodetic Survey to the Chief of Engineers, War Department, thus increasing the amount to \$400,023.47. Of this sum \$399,961.32 was expended, leaving an unused balance on June 30 of \$62.15. From allotments made to the Department from the national security and defense fund there was expended for printing and binding the sum of \$5,573.96. The increase in expenditures in 1919, compared with 1918, was \$10,583.04 (or 2.68 per cent), the expenditures in 1918 being \$394,952.24.

During the decennial census period of three years beginning July 1, 1919, the Bureau of the Census will not participate in the Department printing and binding allotment, as the work for that bureau, including the cost of completing operations on its work remaining unfinished at the close of the fiscal year 1919, will be paid for from the appropriation for the Fourteenth Census. The estimated cost of unbilled and uncompleted work of the Department, exclusive of that of the Bureau of the Census, at the Government Printing Office on July 1, 1919, and chargeable against the allotment for 1920, was \$27,117.40, while such work at the Government Printing Office on the same date in 1918 actually cost \$43,615.41. Including the work of the Bureau of the Census, the figures for this item for the past two years are as follows: 1919, \$64,994.75; 1918, \$74,882.95. There was also at the Government Printing Office at the close of the year work for the Department chargeable against the national security and defense fund estimated to cost \$23,266.89.

Work of the Solicitor's Office.

During the fiscal year ended June 30, 1919, 217 contracts, totaling \$1,541,221, together with 18 contracts of indeterminate amounts; 91 leases, amounting to \$423,938; 20 revocable licenses amounting to \$3,801; 2 deeds in the sum of \$3,305; 108 contract bonds, amounting to \$323,796; 115 official bonds, amounting to \$590,500; and insurance policies amounting to \$137,400 were examined (approved, disapproved, drafted, redrafted, or modified).

The number of legal opinions rendered, formal and informal (memorandum), totaled 258. Legislative matters handled, which concern the Department of Commerce (drafting and redrafting of

bills, reports relative thereto, etc.) numbered 366. In addition, 1,534 miscellaneous matters, embracing everything submitted for the advice or suggestion of the Solicitor, or for the formulation of departmental action, not included in the foregoing items, were handled by this office.

Development of Waterways.

I renew the suggestion that every economic, military, and naval argument urges the earliest possible development of a Government-owned waterway connecting all the great cities of our Atlantic seaboard with one another, with the New York State waterways reaching to the Great Lakes and Lake Champlain, and with all the railroad terminals along our eastern coast.

An important step forward in this connection has been the beginning of condemnation proceedings for acquiring the Cape Cod Canal. This was done, pursuant to the act of Congress (Public No. 37, 65th Cong.) approved August 8, 1917, which provided that the Secretary of War, the Secretary of the Navy, and the Secretary of Commerce should examine and appraise the value of the works and franchises of the Cape Cod Canal with reference to the advisability of the purchase of the canal. The Secretary of War was authorized, if all the Secretaries mentioned were in favor of the acquisition, to enter into negotiations for its purchase. The three Secretaries having concurred in a recommendation that the purchase was desirable, the Secretary of War caused condemnation proceedings to be begun on January 30, 1919. Bills are now pending (S. 2083 and S. 862), providing for the acquisition and operation of the canal by the Government, which have been approved by this Department.

It remains to recite the brief but effective service of several branches of the Department's work undertaken during the fiscal year which have ceased to exist.

Industrial Board.

The Industrial Board of the Department of Commerce was organized with a view to expediting the process of commercial readjustment. When it was formed prices were in a state of flux. The general expectation in the business world was that prices were, in the near future, to fall and every one hesitated to purchase lest they should buy upon a falling market.

It was a voluntary organization of business men composed of seven members, three representing, respectively, the Railroad

Administration, the Department of Commerce, and the Department of Labor, and four representatives of industry. Under the then existing circumstances the board undertook to promote general confidence and hasten the revival of trade by securing the voluntary assent of industries to reductions in prices which were to be such, however, as did not involve either reducing the wages of labor or closing down those individual factories whose efficiency was not as great as the larger ones and who were generally known as "high-cost producers."

The board succeeded in obtaining the assent of the steel industry and of other considerable industries, and marked reductions in prices of steel were announced and recommended to the Government purchasing departments. From these recommendations the Railroad Administration dissented, thinking the prices recommended too high. The final refusal of the Railroad Administration to accept the recommendations of the board resulted in the resignation of the board, which ceased to exist on May 9, 1919. The reduced prices which have been arranged with other industries were never promulgated for this reason. Since then the Railroad Administration has purchased (under protest) steel rails at the prices recommended by the board.

Industrial Cooperation Service.

On January 1, 1919, the Industrial Cooperation Service was formed to take over certain peace-time functions of the War Industries Board. Your approval on December 3, 1918, of my request for \$100,000 from the fund for the national security and defense made it possible to carry on this work during the last six months of the fiscal year. While some of the work had been developed by the War Industries Board, it was carried on there in a restrictive and administrative way, while the Industrial Cooperation Service's policy was promotive and cooperative.

Generally speaking, the Service established a focal point in the Government for the discussion of business and industrial problems. As the work progressed the problems fell within well-defined classes; i. e., those concerned with the standardization of products; those concerned with the search for outlets for waste products and the commercial development of new products; and those concerned with plans for minimizing business abuses. It also acted for this Department with other Government departments in the consideration of industrial matters.

The Service was asked in numerous different cases to seek outlets for by-products or waste products of various industries. The most striking example was the development of the uses of cottonseed-hull fiber, hitherto practically a waste product of the cottonseed-oil industry. Three uses for the fiber were developed: (1) As an insulator for fireless cookers, incubators, etc.; (2) as a binder in the manufacture of composition soles for shoes; (3) as a material for making paper.

It also found an outlet for cotton linters, used so extensively during the war. Cooperating with the War Department, the Bureau of Standards of this Department, and the Forest Products Service of the Department of Agriculture, this Service demonstrated that linters could be used to make a good grade of book paper, and a number of mills have started to work along these lines.

At the request of the Secretary of State this Service investigated the possibilities of starting a submarine telegraph-cable industry in the United States. The reports of the Service were valuable in the consideration of the proposed Government trans-Pacific cable, provided for in Senate bill 1651. One of the important duties of the Industrial Cooperation Service was cooperation with business organizations in formulating plans for minimizing what are known as "trade abuses." At the request of the publishers of books and the National Credit Men's Association the "returned-goods" question was studied. The lowest estimate ever made as to the cost to American business of the unjustifiable return of merchandise was \$25,000,000 annually. This loss, of course, is borne by the ultimate purchaser. The Book Publishers' Association's problems were treated to the satisfaction of all concerned. The larger general problem of the unjustifiable return of merchandise had to be dropped in its early stages because Congress did not appropriate money for the continuance of this Service.

In every instance the assistance rendered by this Service was requested by the industry or business concerned and its activities embraced many fields. The Service provided an admirable place in the Government where business men could come and discuss their difficulties and be assured of sympathetic attention. The refusal of Congress to provide the sum of \$56,000 for the continuance of this productive organization necessitated the conclusion of its activities on June 30, 1919.

Waste-Reclamation Service.

Organized to meet a vital war emergency, resulting from a shortage of war materials, the Waste-Reclamation Service rendered very valuable permanent service during its short existence, in beginning the campaign of education necessary to get the American people in the habit of saving the many things that they have been throwing away. Its chief function was that of education, the action resting with the State and subdivisions thereof, as the advantage accrued to them. Through speeches, publications, and specific advice by letter when so requested, and all the other means open in matters of this kind, this Service sought to aid in the reclamation of waste inorganic materials. By the proper disposal of ashes, garbage, etc., by the communities, not only the materials themselves would be made of use again, but there would be a surplus of money receipts that would reduce taxes proportionately.

The system of disposing by public sale of unused war materials, now being used, was suggested by this Service. Through its initiation and efforts a drive was launched, in conjunction with the Treasury Department, for the saving of materials usually destroyed in the annual clean-up campaign, and payment made therefor in Government Thrift Stamps rather than cash. The Salvage Division of New England estimated that \$250,000 worth of Thrift Stamps would be dispersed by this method during the months of May and June.

A new method of handling waste tin cans was also investigated and called to the attention of the country. The old system of handling these cans emphasized the redemption of the tin removed from the can, while the new system deheads the can and uses the tin in a flat form. Besides reducing the cost of handling the cans, this method increases by about 300 per cent the return to the contractor.

As a means of advising other communities how to proceed, the Akron Industrial Salvage Co. (Inc.), a community waste-saving system, was investigated and a report made covering its operation. Over 15,000 copies of the first edition of this publication were distributed in two weeks and several communities were, after looking into the subject, ready to launch similar systems when this Service had to be discontinued.

An investigation of the present means of disposing of waste paper in Government services was made through the courtesy of the Public Printer, and the report, which was published as House

document 87, Sixty-sixth Congress, first session, showed that in the year 1918 the Government should have received at least \$86,869.35 more for its waste paper than under the contract price. The report also made definite recommendations which, if carried out, would secure from \$50,000 to \$100,000 annually additional from this source.

At the request of the Wool Stock Graders' Association this Service released to the press a statement dealing with the value of shoddy and recommended that the interested associations confer with a joint committee to be composed of representatives of the Departments of Agriculture and Commerce, with the idea of establishing tests for the evaluation of woolen fabrics. The interest shown by several organizations established the constructive value of the statement, and steps were taken to organize the joint committee. At about that time the Service had to be discontinued on account of lack of funds.

Tests were being made to determine the method for utilizing old shoes. This problem was pressing, and demanded immediate study, but also had to be discontinued.

A study of the Army system of garbage segregation as a means of elimination of waste in the preparation of food was in the course of preparation. It is believed that the Army system can be applied to all institutions. An American machine used by the British army was being studied with the idea of recommending that a machine of this type be installed in the institutions for the recovery of fat.

A training course for salvage managers had been outlined and one institution was prepared to institute such a course as soon as this Service had developed the field. Plans for the development of an association of salvage managers had been drawn up and submitted to several leaders in this field for consideration.

The refusal of Congress to appropriate \$25,000 in order that this productive work might be carried on necessitated the disbanding of the Service on June 30, 1919. It will be noted that in one item alone—the study of conditions governing the disposal of waste in the Government Printing Office—a saving of from \$50,000 to \$100,000 per annum could have been made, which would have paid the cost of the entire Service for two years.

Introduction of New Fish Food by the Bureau of Fisheries.

It seems most extraordinary that at this time of high prices for all matters entering into the cost of living, and when urgent

pressure is being exerted to add, because of sore need, to the animal food supply of the world, a work which was successfully developing large quantities of unused, nutritious, and cheap foods should be deliberately cut off.

It is, therefore, with deep regret on behalf of many thousands of our population living in crowded centers along the Atlantic, Pacific, and Gulf coasts and on the shores of the Great Lakes, that I saw the refusal of Congress to grant the sum of \$15,000 to maintain the small but effective staff of our persons that have been successfully engaged in the work of introducing new, abundant, and cheap fish foods, available in large quantities, but either unused or little used. Such fishes, for example, as the Pacific mackerel, the ordinary cod, and the so-called black cod, or sable fish, in the same ocean, find as yet a limited market. The same is true of the burbot and the bowfin of the Great Lakes, and of the whiting of the Atlantic. There are many others. It appears to have been the case that this productive work, having begun during the war, was assumed to be strictly war work, whereas the daily evidence to every housewife in the land of the price she must pay for food is itself witness that the continuance of this work is needed.

It is difficult for me to understand the mental processes whereby so small a sum as \$15,000 was refused for so great a work and one that bore so directly upon the homes and happiness of many times ten thousand people who feel the pressure of current prices. The work had received nothing but praise, which was well deserved. Economy of the sort which stops an effort to bring cheap and abundant food to the knowledge of our people, and forces them, without this knowledge, to buy high-priced foods, is of a curious type.

The matter was brought by me personally before the Appropriations Committees of both the House of Representatives and the Senate, and its peculiar importance at this time was urged upon them, but in both cases without success. Feeling, however, that the subject could not have been fully understood, it was brought before the attention of the House of Representatives by a letter dated July 19, 1919, which forms House Document No. 155, Sixty-sixth Congress, first session, and is printed in full, with inclosures, in an Appendix B to this report, in connection with the discussion of another subject. Subsequent to this the matter was again brought before the Appropriations Committee of the House of Representatives by the Commissioner of Fisheries on September 2, 1919. No appropriation, however, has been made.

One is at a loss to understand the reasoning, if it be such, which leads to cutting off three productive services at a time when their results were effectively helping the solution of a concededly difficult situation. The Industrial Cooperation Service was not an expense to the country, neither was the Waste-Reclamation Service, still less the food demonstration work of the Fisheries Service. On the contrary, these three Services produced wealth. The country was the richer for every month in which they operated. The country is poorer for their stoppage. There is less food to-day available because the Fisheries demonstration work has ceased. Products that are valuable are being wasted in great quantities and values because the Waste-Reclamation Service no longer exists. For lack of the Industrial Cooperation Service production now so sorely needed is, in many places, either delayed or hampered or rendered more expensive for lack of the mutual, helpful touch that Service provided. There is no doubt of these facts. They are denied by no one.

The psychology seems to have been that anything that was born during the war was warlike, in its nature unfitted for peace, extravagant. No discrimination seems to have been made in favor of services which, coming into existence during the war, yet were meant for peace. The besom of destruction was laid upon them. They have been destroyed without regard to their productiveness or their advantage to the country.

This, naturally, leads to the suggestion that Congress makes no difference between productive and unproductive services. It does not practically recognize the difference between expenditure and investment. It adds no force, so far as my experience goes, to demonstrate that the money expended in one case produces a direct profit to the Nation as a whole. It is all treated as expense alike. It is all regarded as something to be cut away, if it be possible, and men who have by careful forethought developed services to a self-sustaining basis are discouraged to find that their efforts not only bring no thanks or appreciation, but that, if the facts concerning them are not disbelieved, they are at least ignored.

Just as the system which Congress uses in dealing with unexpended balances is calculated to promote, and does, in fact, promote, the avoidance of such balances by the deliberate spending at the close of the fiscal year of all available balances for any proper use, so the failure to discriminate between productive and unproductive services directly encourages looseness of admin-

istration and leads men to become careless as to whether their work is profitable or not.

The public in no small measure takes its mental cue from the attitude of Congress, reflected through the press, and assumes all Government appropriations to mean expense, and would be surprised to learn the extent to which many of them are profitable investments. The motor-vessel fleet of the Bureau of Navigation, of the Department of Commerce, costs the Government nothing; instead it has turned into the Treasury, through mitigated fines, a sum sufficient to pay the original cost of the motor vessels and their maintenance, with a surplus. The Bureau of Navigation itself gathers, through the medium of the collectors of customs, navigation taxes which far more than cover its entire outlay. The value at current cash prices of the fish rescued by the seining parties of the Bureau of Fisheries from the overflowed ponds of the Mississippi River between St. Paul and New Orleans is more than sufficient to pay the entire expense of maintaining the 52 fish hatcheries of that service and to present their entire work of producing over seven billion small fish and fish fry per annum as a clean gift to the Nation, free of all expense.

In an industrial corporation the outlook is always toward the productiveness of expenditure; in the Government services the productiveness of the expenditure is almost or quite ignored. It may be said, indeed, that the assumption is that all the services are deemed to return their value in work, else they would not be permitted to exist. If this be so, what shall be said in favor of those services which not only do return their value in work, but in so doing return into the Treasury in cash more than their cost of operation? These, under private management, would be deliberately and necessarily encouraged. These, under public management, are, so far as my experience goes, given no special consideration.

BUREAU OF FOREIGN AND DOMESTIC COMMERCE.

(PHILIP B. KENNEDY, *Director.*)

The decisive factor in the work of the Bureau of Foreign and Domestic Commerce during the fiscal year 1919 was the signing, on November 11, of the armistice between Germany and the allied powers. By that event the year was divided into two distinct periods characterized by divergent aims. It may be said with truth that the termination of hostilities in Europe altered, as by an abrupt shock, the aspect of the commercial world and the trend

of all activities in trade promotion. With the achievement of the great goal, tremendous forces were immediately relaxed, recently created mechanisms were divested of their purpose, and the need arose for diverting to new channels the energies that had been devoted to the winning of the war.

While the armies were still struggling on the western front, private interests were subordinated to the national cause. Trade regulations and restrictions that ordinarily would have been considered shackling were met in a spirit of willing sacrifice. Under circumstances such as these the Bureau of Foreign and Domestic Commerce aided in every possible way the war organizations of the Government and recognized that its researches in foreign markets should be considered as preparation for the change that would inevitably come with the laying down of arms.

The conclusion of the armistice produced a striking change. Dangerous sea lanes became safe again. Artificial economic barriers were gradually let down. New States arose, with freedom of entrance for the investigator and the salesman. In Europe "reconstitution" became the potent word. Provinces had been devastated; industries had been wrecked; the whole normal course of existence had been warped or stifled or turned to alien ends. There was the menace of starvation. Stocks were depleted. Machinery that had supplied the wants of millions lay in twisted heaps of useless rubbish. And, for replenishment, the nations which had suffered looked to the United States. Here, then, was a situation representing at once commercial opportunity and social duty. To Europe the Bureau of Foreign and Domestic Commerce has sent many men to study the needs of the people and the best means of satisfying them.

Since the armistice American producers have been free to resume their trade in South America, the Far East, the Near East, and the many countries where the war emergency had involved a slackening of our effort, and a further incentive is given by the urgent desirability of providing new outlets for the manufacturing facilities called into being by the war. As the industries of the war-racked European nations revive—as adjustments are effected and secure economic bases are evolved—those nations will reach out beyond the seas to find markets for their wares.

American exporters will find their path no easy one. They will need the firmest resolve, the most efficient methods, and, above all, the most accurate knowledge. This knowledge it is

the function of the Bureau of Foreign and Domestic Commerce to supply. American producers should not enter new fields in any groping or hesitant way; they must be equipped with information as comprehensive as it is practical, as pertinent as it is sound. In the gathering and disseminating of such essential facts, the Bureau is proving signally useful to American business. Its aim is to stimulate, to vitalize, and, with patience and continuous application, to smooth the way for export trade. It is expanding and driving ahead with a clear comprehension of the object sought. Its present opportunity is remarkable; and it may be expected to respond with effective service.

Unprecedented Totals for American Foreign Trade.

During the fiscal year 1919 new high marks were established for both the import and the export trade of the United States. Imports of merchandise totaled \$3,095,876,582, as compared with \$2,945,655,403 in 1918 and \$2,659,355,185 in 1917. Domestic exports amounted to \$7,074,011,529, as against \$5,838,652,057 in 1918 and \$6,227,164,050 in 1917. Not considering reexports of foreign goods, the visible balance of trade in favor of the United States on merchandise transactions for the year just ended was \$3,978,134,947, a figure never approached in the commerce of any nation in the history of the world.

The exports of domestic and foreign merchandise to the several grand divisions during the fiscal year 1919 were as follows: Europe, \$4,634,816,841; North America, \$1,291,932,342; South America, \$400,901,601; Asia, \$603,924,548; Oceania, \$208,351,493; Africa, \$85,157,432, making a total of \$7,225,084,257.

Letters of Appreciation Show Practical Results Accomplished.

That the services of the Bureau of Foreign and Domestic Commerce have contributed appreciably to the great growth of American trade with all parts of the world is shown by the many unsolicited letters of commendation received—communications telling of large sales effected through the bureau's aid, mentioning the receipt of data satisfying specific needs, and expressing gratification at the essentially practical and productive character of the work performed. And it is to be remembered in this connection that the concrete results brought directly to the bureau's attention doubtless represent only a small fraction of the trade development that may fairly be attributed to its efforts.

Period of Readjustment in Commercial-Attaché Service.

The bureau's commercial-attaché service the past year has undergone a period of readjustment. War work continued up to the signing of the armistice, while immediately thereafter plans were made for the resumption of the normal activities of trade promotion and investigation. The readjustment period, however, brought its own special problems. For example, in Argentina, Brazil, Japan, and Australia the representatives have been busy with the difficulties involved in the sudden arrival of goods far in excess of immediate needs. Through their efforts the situation was handled effectively without loss to importers, exporters, or bankers. In England, France, Italy, Spain, the Netherlands, and Denmark the attachés have had to deal with questions arising out of the relaxation and modification of war-time trade restrictions.

An important development in connection with the commercial-attaché service was the sending out of trade commissioners to conduct general investigations under the direction and supervision of the commercial attachés. Early in the fiscal year Herman G. Brock was sent to London to assist Commercial Attaché Kennedy in carrying on the strictly commercial activities that were necessarily being pushed aside by the war work. Mr. Brock furnished the bureau with timely reports and was also able to assist Mr. Kennedy materially.

Shortly after the armistice the Department of Commerce recognized the necessity for a greatly increased force in Europe to keep in the closest possible touch with important developments and trade tendencies. The President allotted \$200,000 from the fund for national security and defense, and by the latter part of February trade commissioners and clerks were dispatched to Europe.

Ten trade commissioners worked on general investigations directly under the supervision of the commercial attachés. Their investigations covered a wide variety of commercial, financial, and industrial subjects.

Activities of Attachés in Europe.

Coming now to a consideration of the commercial-attaché posts themselves, the London office should be mentioned first. Commercial Attaché Philip B. Kennedy was engaged in war work in addition to the normal activities of his office. Besides handling mineral and tin problems for the War Trade Board and aiding the War Department in the purchase of urgently needed materials, Mr. Kennedy took over during the latter part of the year the entire

handling of the Swedish iron-ore and Norwegian molybdenum contracts, for which the President put at the disposal of the Secretary of Commerce \$6,000,000 from the fund for national security and defense. Mr. Kennedy has cooperated closely with the ambassador and the consul general in the matter of British import restrictions. One of the most important features of the work in London during the year was the cooperation between the office of the commercial attaché and the American Chamber of Commerce in London. The attaché was an ex officio member of the trade information committee, and his office was represented at its weekly meetings. The office in London made first-hand investigations of markets for American products. For example, the possibilities for the sale of American cottonseed-hull fiber were carefully analyzed. Through the commercial attaché American producers of dyestuffs were put in touch with officials of the Italian Government. Mr. Kennedy represented the United States unofficially at the Interallied Parliamentary Conference held in London, July 2 to 4, 1918, and submitted reports upon the deliberations of the conference. During April Commercial Attaché Kennedy returned to the United States to confer with the officials of the bureau and meet business men interested in post-war conditions in England. The customary tour of commercial centers was made and many conferences held. As a result of an invitation extended through Mr. Kennedy to the Chamber of Commerce of the United States in behalf of the Associated Chambers of Commerce in Great Britain, the former body decided to bring to this country in the early fall, for a discussion of industrial and financial reconstruction problems, commercial delegations from the allied nations in Europe. In July, 1919, Mr. Kennedy was appointed Director of the Bureau of Foreign and Domestic Commerce.

Pierce C. Williams accompanied to Paris the War Trade Board representative and, under his direction, organized and operated for several months the American office of the Interallied Contingent Commission and continued to assist, to an extent, in the work of the War Trade Board. He submitted timely and valuable reports on such subjects as French industrial reconstruction, the formation of consortiums and comptoirs, import restrictions, and cooperative selling by American interests. He made an investigation of economic conditions in Switzerland. Mr. Williams resigned to enter private employ, and Chauncey Depew Snow, formerly Assistant Chief of the Bureau, was appointed commercial attaché and took charge in Paris March 24, 1919. Mr. Snow also has kept in inti-

mate touch with reconstruction problems. Tariff questions and changes in import restrictions have been closely followed. The attaché has cooperated with the Rhineland High Commission, the officials in charge of the sale of Army supplies and equipment, and the Supreme Economic Council, as well as with the American Chamber of Commerce. As an example of the tangible results accomplished by Mr. Snow, I may mention the assistance given to individual import applications for American goods, even to the extent of preventing the confiscation of such goods.

At the beginning of the fiscal year Commercial Attaché Erwin W. Thompson was in London, continuing the work with the War Trade Board begun in March. He returned to Copenhagen in July and resumed his intensive study of the Scandinavian and German press. This study and daily contact with commercial and financial men throughout the Baltic region enabled him to furnish authoritative reports on economic subjects. Through one of his reports the United States Shipping Board was enabled to obtain from a Danish factory large Diesel engines urgently needed. Mr. Thompson worked out plans for financing shipments of American cotton and other commodities into the new Baltic countries by a system of dividing up the credits between the American shipper and the Danish institutions in a way that keeps the American shipper always secured by safe shipping or warehouse documents. Other special activities included an investigation of textile substitutes, a study of methods to be used in reconciliation of trade disputes, a survey of Scandinavian sources of supply of foodstuffs and other products for the American Expeditionary Force, and inquiries as to the establishment of an American chamber of commerce in Copenhagen.

During the entire year Commercial Attaché Paul L. Edwards acted as the American representative on the Interallied Trade Committee at The Hague. Mr. Edwards served as the agent of the War Trade Board and the American minister in carrying out the various agreements with the Dutch Government, including the handling of the correspondence with the Netherlands Oversea Trust. During November, 1918, he visited London to confer with allied representatives regarding the various Dutch economic agreements. Several trips were made to Paris to confer with the Supreme Blockade Council concerning blockade administration and the shipping of foodstuffs to Germany under the Brussels agreement. Mr. Edwards also reported on current commercial and financial matters.

Commercial Attaché William C. Huntington spent most of the year in the United States because of the unsettled conditions in Russia. During the early part of the fiscal year he was in Moscow aiding our diplomatic and consular officers. He left Russia in the fall, reaching the United States in November after visiting Stockholm, London, and Paris. In Washington, Dr. Huntington has held many conferences with officials of other Government departments interested in Russia. Besides making numerous addresses, he has organized the Russian division of the bureau.

In the fall of 1918 it was decided to establish a commercial-attaché post at Madrid, and the position was offered to William A. Montavon, who had served in Lima, Peru. After the resignation of Mr. Montavon, Chester Lloyd Jones was appointed and opened his office March 5, 1919. At this post the work has been largely of a trade-promotive character. Mr. Jones has assisted the embassy in connection with our commercial treaty relations with Spain, and kept in close touch with proposed tariff legislation. He secured the revision of discriminating tariff classifications affecting American trade. Our ambassador in Spain has expressed his gratification at the valuable services rendered by Mr. Jones, and has recommended the assignment of additional assistants in the office of the commercial attaché at Madrid. The representations of our attaché were largely responsible for the recent granting to a New York company of the important concession for exploiting extensive potash deposits north of Barcelona. This single achievement is sufficient to justify the maintenance of the attaché's office and the expenditure it involves. Other activities worthy of special mention include assistance to the Liquidation Commission of the Army, cooperation with the American Chamber of Commerce in Barcelona, and special reports on Spanish trade conditions.

The second new post opened during the year was at Rome. Commercial Attaché Alfred P. Dennis reached his post in March, 1919. Through his efforts and those of his assistants, import permits were issued for 8,000 packages of American goods that had been held for six months at Genoa. Among other products, American tractors, shoes, hosiery, tubing, steel, and chemicals were admitted upon the representations of the attaché's office. Mr. Dennis assisted the embassy in obtaining equal treatment for American goods discriminated against in Italian treaties with other nations. He has discussed with the Director of Economic Policy and the Director of Customs questions relating to the

admission into Italy of American products. He has also aided firms seeking to establish themselves in the Italian market.

Results Attained by Far-Eastern Offices.

During the first half of the fiscal year Commercial Attaché Julean Arnold was in Shanghai, serving as chairman of the International Maritime Customs Conference. During Mr. Arnold's absence the office at Peking was in charge of A. W. Ferrin and Paul P. Whitham. In cooperation with a representative of the War Trade Board, Mr. Ferrin initiated negotiations for the sale of 5,000 cars and 100 locomotives to the Chinese Government Railways under a car-trust agreement. Mr. Arnold assisted in the organization of a new American bank in China, as well as in that of a joint Chinese-American bank. As a result of his efforts, equipment for 10 cotton mills was purchased and installed in China. He aided in establishing an American tannery, had a share in the sale of American cars and railway equipment, and aided American architects to obtain contracts in China. American industrial films have been exhibited to acquaint the Chinese business public with American equipment and methods of production. The attaché has worked for the protection of American trade-marks, and has furthered the establishment of an American news service and better shipping facilities to China. With the aid of American consular officers he has prepared a comprehensive handbook of China. Mr. Arnold is now on his way to the United States.

Up to the signing of the armistice Commercial Attaché Frank R. Rutter, at Tokyo, was chiefly engaged with problems arising out of trade restrictions and with the study of industrial and economic conditions. Dr. Rutter left for the United States in December to accept an important position on the staff of the bureau in Washington. James F. Abbott was appointed to succeed him. Since his arrival at his post in March, Mr. Abbott has been renewing contacts in Japan and has been keeping Americans acquainted with commercial developments.

In Australia, A. W. Ferrin, by addresses before commercial bodies and through press contributions, has aided in removing misunderstandings as to American trade methods and ideals. Another important service has been in connection with the amicable settlement of large claims made against Americans by Australian importers. Mr. Ferrin has done excellent trade-promotion work, and substantial business has resulted from his aiding Australians to obtain American agencies.

Work of Attachés in Latin America.

The office at Buenos Aires was largely occupied with war work. Commercial Attaché Robert S. Barrett was also the representative of the War Trade Board and the Shipping Board. Mr. Barrett obtained the cooperation of the commercial representatives of the allied Governments and organized a committee, of which he was elected chairman, to take joint action on all enemy-trade matters. He also suggested and assisted in the organization of the Allied Chamber of Commerce of Buenos Aires. To the Shipping Board Mr. Barrett made important and exhaustive reports. During the shipping strike he rendered notable service. Mr. Barrett also devoted considerable time to trade promotion. Largely through his efforts, the United States Chamber of Commerce in Buenos Aires was organized. Many representatives of American firms were assisted, and in one instance an initial order of \$100,000 worth of rubber goods was secured. Mr. Barrett made frequent and extensive reports on timely subjects. He resigned April 1 to enter private business, but returned to the United States and spent three months conferring with business men before his resignation was accepted. Dr. Julius Klein, who had served as chief of the bureau's Latin American division, was appointed commercial attaché at Buenos Aires.

J. E. Philippi was appointed commercial attaché at Rio de Janeiro, arriving at his post November 3, 1918. He has devoted considerable time to a unification of the American commercial organizations in Brazil into an effective body, the American Chamber of Commerce for Brazil. The organization, with the aid of Mr. Philippi, has assisted in negotiations concerning arbitration of commercial disputes. The attaché has made a close study of the Brazilian tariff. Following the armistice unusually heavy import shipments were received, and in many lines stocks were largely in excess of immediate needs. The attaché was instrumental in working out plans for handling the situation without loss to the parties interested. Mr. Philippi has kept the Department informed with respect to shipping facilities, freight rates, etc., has submitted many valuable reports on other important subjects, and has aided in various ways American exporters.

During the greater part of the year the office at Lima, Peru, has been in charge of Robert E. Hurd, secretary to the commercial attaché. Mr. Montavon returned to Washington in October to confer with exporters. However, Mr. Montavon decided while in

this country to accept an important place with a private organization. His trip through the United States was highly successful. While at Lima the attaché was chairman of the subcommittee of the Allied Conference of Ministers that considered war-trade problems. After the departure of the attaché, Mr. Hurd continued these activities, acting as secretary for the organization.

Usefulness of Attaché Service Clearly Demonstrated.

The commercial attachés in South America have submitted special reports on the openings for American marine-insurance operations, markets for drawing instruments and architects' supplies, and German competition in all its phases. The attachés at Copenhagen, The Hague, and Paris have studied the status of the German dye industry. Our representatives in Paris and Rome were able to assist the important commissions representing the National Industrial Conference Board and the World Cotton Conference, while the London and Paris offices were of similar assistance to the commissions representing the shoe and leather trades and the Merchants and Manufacturers' Board of the Cleveland Chamber of Commerce. The attaché service created interest in the exhibition held in Philadelphia in June under the auspices of the National Association of Hosiery & Knit Goods Manufacturers.

A striking example of the usefulness of the service is found in its cooperation with the United States Sugar Equalization Board, which asked the bureau whether the attachés could assist in opening up foreign markets for sugar. The attachés were instructed to give the matter publicity as well as take it up directly with foreign importers. Soon the export demand became so heavy that the board found it necessary to restrict the exportation of sugar.

As another example of the utility of the service, I may mention the cooperation of the Bureau with the Bureau of Markets of the State of South Dakota in finding markets for range horses in Europe.

Vital Work Accomplished by Trade Commissioners.

The division of foreign investigations has aided the war activities of such organizations as the War Trade Board, the War Industries Board, the Council of National Defense, the Shipping Board, and the War Department. Trade Commissioner Axel H. Oxholm rendered important services in connection with the inspection of timber for the American Expeditionary Force. Trade Commissioner Norman L. Anderson kept closely in touch with matters

of interest in the Scandinavian countries, Finland, Germany, and elsewhere. Nels A. Bengtson, trade commissioner at Christiania, cooperated with special representatives of the War Trade Board in Norway.

The lumber investigations conducted by Trade Commissioners Axel H. Oxholm, Roger E. Simmons, Nelson C. Brown, and John R. Walker were practically completed at the end of the fiscal year, and their reports will appear shortly. Upon returning to the United States, each of the investigators made a tour of the principal lumber centers, giving first-hand information concerning the results of his trip abroad. Great benefit will unquestionably be derived from the personal suggestions of the commissioners, as well as from the material in the forthcoming monographs. The regions covered in the investigation were Finland, Sweden, and Norway; Russia and Siberia; the Spanish Peninsula, Italy, and Greece; and Great Britain, France, Belgium, and the Netherlands.

The year witnessed the completion of the field work in the investigation of South American furniture markets by Harold E. Everley and the publication of his book entitled "Furniture Markets of Chile, Peru, Bolivia, and Ecuador." His reports on the east-coast countries will soon appear.

Trade Commissioner W. W. Ewing finished his study of the opportunities in South America for the sale of American construction materials and machinery. A bulletin was published embodying the information that he gathered in Chile, Peru, and Ecuador, and reports on Argentina, Bolivia, Uruguay, and Brazil are being prepared.

Charles C. Hanch conducted a short investigation of the automobile situation in England and on the Continent of Europe.

"Jewelry and Silverware in Cuba" represented the first tangible result of the investigation by Samuel W. Rosenthal into the Latin American markets for the articles indicated. Various other monographs are soon to be published.

Trade Commissioner J. W. Sanger finished his study of advertising methods and conditions in the Latin American countries. His reports are most pertinent and interesting.

Oliver M. Smart has returned to the United States with valuable data on the market for electrical goods in Italy.

During the past year William M. Strachan investigated the production and exportation of certain tropical products in Central America and Colombia, at the request of the United States Shipping Board.

Henry Wigglesworth made a short survey of the general situation in the chemical industries of Europe.

There is now in press a monograph on "Electrical Goods in Argentina, Uruguay, and Brazil," written by Trade Commissioner Philip S. Smith to complete the series resulting from his South American investigations.

The other specialized investigations completed during the year include those of W. G. Marshall on industrial machinery in Italy; H. Lawrence Groves on agricultural machinery in France; Charles P. Wood on industrial machinery in France and Belgium; and Arthur N. Young on financial conditions in Spain.

Trade Commissioner Edward F. Feely made a survey of general commercial and economic conditions in Mexico and has now been appointed commercial attaché at Mexico City.

Louis E. Van Norman was appointed trade commissioner to investigate general trade conditions in Rumania and was stationed at Bucharest for about six months. Having obtained important data on fundamental economic factors, he has returned to this country to give American business men the benefit of his observations.

Leslie C. Wells was assigned to the party of the French Institute in the United States that has been making a tour of France, including the devastated regions.

Among other general investigations should be mentioned those of Nels A. Bengtson in Norway, Harry T. Collings in Belgium, and Eliot G. Mears in Greece. Mr. Mears has been ordered to proceed to Constantinople, to report on general commercial and economic conditions. Mr. Bengtson and Mr. Collings are returning to the United States. General investigations that are continuing as the fiscal year ends are those of P. L. Bell in Colombia and Venezuela, John A. Fowler in the Dutch East Indies and Straits Settlements, Vladimir A. Geringer in Czechoslovakia, and R. A. Lundquist in South Africa. Upon the completion of his work in South Africa (including the preparation of a report on the electrical-goods trade), Mr. Lundquist is expected to proceed to India to study the market for electrical goods in that country.

William L. Schurz was appointed trade commissioner in February to make a general investigation in Bolivia and Paraguay. No trade commissioners have been located in those countries before, though short visits to the principal centers have been made by several commodity investigators of the bureau.

Special investigations now in progress include those of J. Morgan Clements of mineral resources in China; Courtenay De Kalb of mineral resources in Spain; L. S. Garry of textiles in South America; Harry F. Grady of financial conditions in England and on the Continent; Norman L. Hertz of leather in Europe; Alexander Luchars of machine tools in England and on the Continent; W. H. Rastall of industrial machinery in the Far East; Paul P. Whitham of transportation and port facilities in China.

District and Cooperative Offices.

As with other branches of the bureau's activity, the work of its district and cooperative offices during the past year falls naturally into two divisions—that performed before the signing of the armistice and the work undertaken subsequent to that date.

While the actual handling of export and import licenses was taken out of the hands of the district and cooperative office managers some time before the beginning of the past fiscal year, a great many requests and inquiries continued to reach these offices with respect to the war regulations of this country and of foreign nations. It is estimated that approximately 25 to 35 per cent of the time of the employees of these offices was taken up in furnishing information of this character and in advising business men as to the proper procedure in complying with these war-time regulations while still conducting as much foreign trade as possible.

After the armistice, the urgent demands from American business men for advice and assistance in relation to the new markets taxed severely the limited personnel of the bureau's branch offices. Manufacturers and exporters have, for the most part, expressed deep appreciation of the manner in which their requests were handled.

Probably the most notable feature of the work of these offices after the signing of the armistice was the arrival in this country of a comparatively large number of foreign business men desiring to be placed in touch with American merchants. This is a service for which the district offices are peculiarly fitted, each office manager being in close contact with the business interests of his district and being able, therefore, to place foreign buyers in direct communication with firms which can supply their requirements.

Another feature of the work that has developed greatly during the past year has been the investigation of complaints made against American firms by foreign dealers. In such abnormal conditions as those prevailing during the war it was inevitable

that misunderstandings and mistakes should occur. The district and cooperative offices of the bureau have been eminently successful in adjusting these difficulties amicably and without recourse to legal procedure. The effect of this work upon foreign good will toward the United States is evident.

Work in Connection with Latin America.

June 30, 1919, marked the end of the busiest and probably the most useful year in the history of the bureau's Latin American division, organized in 1916 for the general purpose of promoting American trade with all countries and colonies in the Western Hemisphere to the south of the United States. During its comparatively short existence a large quantity of economic information has been accumulated, the development having been especially rapid subsequent to the entrance of the United States into the war. Like all public and private institutions, the Latin American division has found the fiscal year 1919 composed of two distinct phases—that from July 1, 1918, until the signing of the armistice on November 11, and that after November 11, 1919.

Early in the war the division was called upon to cooperate actively in many aspects of war work involving Latin American affairs. About 50 per cent of the time of the division during the duration of the war was given to the preparation of economic material for war uses and to assistance rendered to investigators from other Government offices. In some instances the war organizations found it necessary to maintain in the division members of their staffs on full-time work. The four offices of the War Department maintaining closest contact with the division were the military intelligence branch, the air-craft procurement division, the gas-defense service, and the Surgeon General's Office.

The division was in particularly close touch with the Shipping Board because of the necessity for careful study of ship service to Latin America with a view to curtailing that service to a minimum in order to supply tonnage for trans-Atlantic troop and munition movements. The files of the division were used as the foundation for data relating to such questions as Mexican petroleum, Latin American merchant marine, fuel supplies of South American countries, interned German shipping in Latin American ports, and Japanese ship movements to South America.

The division was called upon constantly by the War Trade Board for advice on the granting of licenses for exports to Latin America, with special reference to the actual necessity for the

given commodity in the consuming countries. As the board undertook to establish its own field service, its various appointees were given special preliminary training in the Latin American division before departing for their posts in the southern countries.

The division furnished to the Food Administration a number of comprehensive tabulations relating to the trade in sisal fiber, sugar, bananas, coffee, and cereals.

Aid was given to the Geological Survey in its investigations of the Latin American supplies and the proprietary control of such minerals as nitrate, petroleum, coal, tin, zinc, manganese, platinum, antimony, and tungsten.

For the Federal Reserve Board members of the division wrote brief treatises covering the effects of the war on exchange in Brazil, Uruguay, Argentina, and Chile.

Data and suggestions were supplied to the Committee on Public Information.

Investigations were conducted regularly for the Foreign Trade Adviser's office of the State Department.

The division also cooperated in collecting economic data for use at the Peace Conference. Numerous reports were prepared for this use.

While the time of the Latin American division was primarily occupied with the war activities above enumerated, prior to the signing of the armistice, the work of supplying trade information to private interests was not neglected. It was often called upon to act as a mediator between private business and the Government war organizations.

The revolution in commercial activity that took place after the cessation of hostilities was reflected in the work of the Latin American division. Manufacturing industries turned to foreign markets as outlets for their production. The average number of letters of trade information written weekly by the division, in response to inquiries received from business houses, increased from 89 in July, 1918, to 220 in April, 1919. The number of visits by export managers, salesmen, and officials of manufacturing firms and export houses grew to 35 or 40 per week.

One of the most encouraging features of the trade-promotive work of the Latin American division has been the regularity with which its services have been used by business institutions recognized as among the most important in the United States. Among them may be mentioned practically all the American banks that

have branches or affiliated houses in Latin America, the more prominent steel companies, many of the strongest export and import houses, investment and financial institutions, and many others among the leaders in their respective industries, such as textiles, chemicals, paints and varnishes, jewelry, rubber, motor cars, agricultural implements and machinery, industrial equipment, railway supplies, electrical manufactures, explosives, timber, hardware of all kinds, construction materials, foodstuffs, and, in lesser volume, practically every variety of manufactures.

So far as has been practicable in view of the time necessarily occupied by work of more immediate importance, the division has prepared, on subjects of timely interest, articles involving original research. These reports, to which the name of "Latin American circulars" has been given, were issued during the past year at intervals of approximately two weeks and have been published in Commerce Reports. The series has included reports on the trade balance and foreign exchange of Uruguay and Brazil; railways and railway development in Mexico, Brazil, Peru, and Argentina; petroleum and general trade conditions in Mexico; studies of paint and varnish and automobile markets; and other miscellaneous subjects. A gratifying appreciation of this phase of the division's work has been evidenced not only by personal letters but also by the reprinting of such studies in trade journals and the daily press.

During the last weeks of the year the division prepared a complete syllabus for the use of instructors in Latin American trade courses and of students who desire to pursue such study independently. This work comprises four courses on the main divisions of Latin America, including preliminary references to the history and social heritage of each nation as well as a review of the physical features, transportation, native products, banking and finance, and economic characteristics peculiar to the region under consideration. Commodity studies based mainly on the official reports published by the Bureau of Foreign and Domestic Commerce form the practical end of each course. This syllabus will be embodied in a bulletin to be issued by the Federal Board for Vocational Education about the first of September, 1919.

Promotion of Trade with Far East.

The Far Eastern division accumulates and distributes trade information in a variety of ways. It clips and files all pertinent articles appearing in about 20 representative Far Eastern trade

papers. In order to insure as extensive a circulation as possible for data of this character, a weekly digest of the clippings is made and published in Commerce Reports. These "press notes" are widely copied in trade and news papers throughout the United States. The value of thus directing intelligent inquiry is manifest; it discourages the old type of "dagnet" inquiry that is so difficult to handle and, with more beneficial results, excites the interest of merchants and manufacturers in available material of a specific nature. Lists of selected titles, from the clipping files and the card index of articles in periodicals, are distributed to the bureau's district and cooperative offices.

The duplicate replies of consuls to trade inquiries are filed in the Far Eastern division, and their gist is summarized on cards. Letters of special interest form the nucleus of articles in Commerce Reports, under the heading "Far Eastern trade notes." For Commerce Reports, also, the division prepares summaries of forthcoming monographs by the field investigators of the bureau.

Special lines of investigation for commercial attachés and trade commissioners are suggested by the division, based upon inquiries received from American sources.

The division is assembling a library of great practical value. Yearbooks, directories, studies of economic conditions, official reports of foreign Government departments and bureaus have expanded the bookshelves from 4 to 15 sections.

In the distribution of the information thus accumulated probably two-thirds of the effort has been expended in answering individual inquiries. These have increased from about 25 per week in July, 1918, to more than 125 per week at the termination of the fiscal year. In a surprisingly large number of cases the division has been completely successful in supplying the exact data required.

It was early discovered that there was a steady call for comprehensive surveys of the Far Eastern markets for certain articles entering largely into the export trade of the United States. To meet this demand, 18 circulars discussing the opportunity for such goods in practically all important Far Eastern markets have been prepared and given wide circulation through Commerce Reports and by mailing to a special list comprising virtually all the American manufacturers and exporters actively engaged in trade with the Orient. These circulars have had gratifying results.

The miscellaneous activities of the division during the year have been numerous and exacting. It was called upon for advice con-

cerning the desire of the Chinese Government to purchase railway equipment. It gave attention to the bill introduced in Congress for the incorporation under Federal law of companies engaged in foreign trade exclusively. The subject of better cable facilities across the Pacific was taken up. At the request of the Shipping Board, the division suggested two routes for transpacific steamship service, the accumulation of the necessary data involving much research. The division has been called upon frequently to clear up trade disputes of a peculiarly aggravated nature. A number of addresses before trade bodies have been made by members of the division.

Establishment of Russian Division.

Among the important undertakings of the bureau during the fiscal year was the organization of a Russian division, under the direction of Dr. William C. Huntington, commercial attaché to Russia. Dr. Huntington was in Russia during the last days of the imperial régime and the entire period from the revolution of March, 1917, to the withdrawal of the American diplomatic representatives.

The Russian division was organized in January, 1919, the staff consisting at first of only the chief and a stenographer. Two additional persons were engaged in March, and since April the work has been very actively carried on. The aim of this work is (1) to make a thorough study of Russia and to build up a collation file of sound, tested information, as well as to form a good library; (2) on this basis to furnish accurate information to business interests; and (3) to form a center for all sorts of American-Russian trade relations.

Numerous articles and translations prepared by the division have been published in Commerce Reports. Russian currency, mineral resources, the flour-milling industry, the beet-sugar industry, the market for textiles and clothing, the port of Archangel, the resources and trade possibilities of Poland, etc., have formed the subjects of such reports.

Many business men, both Russian and American, have visited the division. The cooperative societies and their projects have occupied much time. A large number of inquiries have been answered relative to general conditions in Russia and Siberia, as well as special branches of trade and manufacture. About 300 of these letters have been in the nature of real reports to the inquirers.

The division has endeavored to obtain publications from all sources and has worked in close cooperation with other divisions of this Department and also with the Department of State, the Department of Labor, the Shipping Board, and the War Trade Board. It has worked with the military intelligence division of the War Department.

The division has cooperated effectively with such organizations as the American-Russian Chamber of Commerce, the Russian-American Committee for the Far East, the Russian Embassy, the consulate general of the Republic of Poland, the Russian Economic League, the National City Bank of New York, the National Bank of Commerce, the National Association of American Manufacturers, and various chambers of commerce. Attempts have been made to get in touch with chambers of commerce abroad, in Harbin, Omsk, and Archangel. Arrangements have been made with the State Department to obtain periodically data from representatives in the United States of States organized from portions of the former Russian Empire.

It is confidently believed that this new Russian branch of the bureau's activity will contribute very substantially to an understanding of the Russian problem, aiding Americans to take advantage of an ultimate opportunity for the utilization of capital and the supplying of merchandise to 180,000,000 people.

Extraordinary Demand for Commercial Information.

The bureau's division of trade information, which supplies, through correspondence and personal interviews, data on foreign markets other than Latin America, the Far East, and Russia, sent out approximately 45,000 communications during the past year. Since the signing of the armistice the facilities of the division have been taxed to meet the truly phenomenal demand for commercial information. Upon the cessation of hostilities American manufacturers whose establishments had grown as a result of war orders began to seek means to keep their plants and organizations intact, and thus avoid the unpleasant task of reducing their forces and curtailing production. The inquiries received by the bureau show that a remarkably large proportion of these concerns have turned to foreign trade as a solution of their problems.

In connection with its trade-promotion work the bureau maintains close cooperative arrangements with the principal commercial organizations throughout the United States. An important supplemental publicity is thus given to the bureau's publica-

tions and special services. In turn, the division of trade information is often able to be of definite assistance to such associations and their individual members. It is called upon frequently by newly established associations, planning the organization of foreign-trade departments, for advice and constructive suggestions that will assist them in initiating, developing, and carrying on a special service of this kind.

Division of Statistics.

During the first half of the year the efforts of the division of statistics, aside from the regular work of preparing the statistical publications, were directed mainly toward furnishing the special war bureaus with the detailed foreign-trade statistics required by them.

The various divisions of the United States Shipping Board made probably more extensive use of the statistics than any of the other war offices. As a basis for the control and allocation of ships for imports of essential war materials for which the United States was dependent upon foreign sources, the division of planning and statistics of the Shipping Board was supplied regularly with reports of imports during 10-day periods. The port and harbor facilities commission of the Shipping Board made extensive use of the monthly reports showing imports and exports of each customs district by articles and countries. The division of operation made extensive use of the bureau's reports of "Vessels entered and cleared in the foreign trade," while the division of trade was given aid in the construction of tables showing commerce in leading staple articles by ports and countries.

The Food Administration and the Bureau of Markets of the Department of Agriculture were furnished with 10-day reports of imports and exports of foodstuffs and agricultural raw products.

The several divisions of the War Industries Board and the Council of National Defense made constant inquiries for foreign-trade statistics in connection with their work of priority rulings, price fixing, and other war restrictions, and received numerous special monthly and 10-day statements.

The Geological Survey, the Bureau of Mines, and the interdepartmental War Minerals Committee were kept regularly supplied with the latest statistics on imports and exports of non-ferrous metals, coal, mineral oil, nitrogenous materials, and other essential minerals.

The War Trade Board made constant use of the import and export statistics, its bureau of research being regularly furnished with copies of the 10-day and monthly export reports, and every facility was afforded its officials to keep their statistical records up to date. Numerous special tables were also furnished to that board.

Among the other Government establishments to which information was supplied by this division were the Central Bureau of Planning and Statistics, the Committee on Public Information, the Alien Property Custodian, and the Director General of Railroads. In many cases extensive research and compilation were required.

Since the signing of the armistice this extensive use of the bureau's foreign-trade statistics has gradually diminished, so far as the war boards are concerned, while there has been a corresponding increase in the demands by private industries and commercial organizations. It is the policy of the division to furnish as complete statistics as possible bearing upon the inquiries submitted.

For several years the division has maintained a limited service of special monthly statements to certain parties, giving more details than the published reports. It was decided to extend this service by furnishing it to such trade journals and commercial organizations as would agree to give publicity to the statements. The demand has exceeded all expectations. The work was started with statistics for December, 1918. After it had been in operation for six months, 1,178 copies of 81 statements of imports and exports during May, 1919, were furnished to about 300 different addresses, mostly those of trade organizations and commercial journals.

Special arrangements have been made with local correspondents of trade publications by which they are given access to the copy for the Monthly Summary before it is sent to print. Thus the figures of imports and exports in the principal lines of industry—including, among others, automobiles, textiles, iron and steel, and hides and leather—appear in the trade journals a week or more in advance of the official statistical publications.

The Department of Commerce is aware of the importance of promptness in the statistical service and is giving much attention to the coordination of the bureau's work with that of the Customs Service of the Treasury Department, through which the reports are collected. In recent months there has been a notable improvement in this regard.

An act of Congress approved January 25, 1919 (S. bill 4924), amended section 336 of the Revised Statutes by requiring that the annual report shall be issued to cover the calendar instead of the fiscal year, because of the greater demand for figures relating to the former period. For 1918 the bureau undertook to prepare, in addition to the fiscal-year report, an annual report on the Foreign Commerce and Navigation of the United States for the calendar year. In order to provide a continuous record for the intervening period between the fiscal and calendar years, the figures for the half year from July 1 to December 31, 1918, are shown in all of the tables in addition to the calendar-year figures.

Steps are being taken to change the tables in the foreign-commerce section of the Statistical Abstract from fiscal to calendar years.

The usual publication Trade of the United States with the World, showing imports and exports in the trade with each foreign country by articles, was brought up to date for 1918 and issued as Miscellaneous Series No. 78. A special compilation was made and published in Commerce Reports of the imports into and domestic exports from the United States during the calendar year 1917, stated in the terminology of the international classification agreed upon at the International Statistical Congress at Brussels in 1913.

To remedy the lack of detail in the foreign-trade statistics, a revision and extension of the export classification was undertaken in the latter part of the fiscal year. An interdepartmental committee was appointed, comprising representatives of the Treasury, Agriculture, and Commerce Departments, the Shipping and War Trade Boards, and the Tariff Commission, for the purpose of preparing an entirely new classification applicable to both imports and exports. It was decided that the present alphabetical arrangement should be discarded and that the commodities in the new classification should be grouped in 10 great classes according to their character, the origin of the component materials rather than their use being the guiding principle in classifying. Each of the 10 main groups is to be divided and subdivided into subsidiary groupings, the decimal system of numbering being used in order to facilitate mechanical tabulation and to provide elasticity for future expansion. Comparability between imports and exports is to be preserved, but in cases where the imports or exports are not of the same importance for certain groups the classification

need not be shown in the same detail. Quantities are to be shown in all cases either in standard commercial units or in weights.

Trade organizations and experts have prepared detailed schedules for their particular lines. The arrangement and condensation of the various classifications submitted has proved a huge task. It had been planned to put the new classification into effect on January 1, 1919, but this was found impracticable, and the work has continued uninterruptedly up to the present time. It is expected that January 1, 1920, will be the effective date, unless some now unforeseen event should make further postponement necessary.

Original Research and Compilation of Foreign Statistics.

In the research division of the bureau there were prepared during the year, in addition to the Statistical Abstract of the United States and the annual pamphlet on wholesale prices, special publications on Statistics of German Trade, Statistics of Austro-Hungarian Trade, International Trade in Footwear, and International Trade in Cement. The two reports on the commerce of the central Empires have proved of great value to students of their economic development, as well as to business men who are interested in the markets formerly supplied from Teutonic sources. Studies are in course of preparation covering the international trade in cotton goods, motor vehicles and bicycles, horse-drawn vehicles, agricultural implements and machinery, paper and its manufactures, electrical goods and machinery, and manufactures of leather other than boots and shoes.

The research division prepared the statistical tables for the bureau's monograph on Economic Reconstruction in European Countries.

In order to assist in placing American oversea trade on the firmest possible basis, one of the experts of the research division, during the last half of the fiscal year, has paid special attention to the possibilities of employing American capital abroad. In the Far East and Latin America are great resources that have scarcely been touched, and it is believed that this branch of the bureau's activity will conduce very materially to the profit of American financiers and merchants.

Division of Foreign Tariffs.

During the past year the publication work of the bureau's division of foreign tariffs had to be largely subordinated to the rapidly

growing correspondence, dealing primarily with the great number of foreign restrictions on commerce. The increase in the division's mail was particularly noticeable after the armistice, reaching a monthly average of nearly 1,000 letters, compared with an average of less than 250 during the preceding year. Inquiries regarding foreign rates of duty were comparatively few. The foreign import restrictions, on the other hand, formed a very serious obstacle to export trade, and it required a considerable amount of ingenuity and diplomacy to get the average exporter to see the broader problems of exchange, international commercial policies, and national interests involved in the import prohibition on the particular article in which he was interested.

The work of the division in connection with foreign trade-mark legislation, and especially the examination of official publications with a view to detecting attempts to pirate American trade-marks, has been considerably extended and has resulted in a number of very desirable new connections among American firms. The division has also succeeded in aiding American firms to recover trade-marks that had been appropriated by their agents.

The question of the expansion of American parcel-post facilities with foreign countries has figured rather prominently in the work of the division, which has kept in close touch with the activities of the Post Office Department along those lines. It is gratifying to note that the economic importance of parcel post is receiving increased recognition and that parcel-post service to a considerable number of countries has been inaugurated during the past year.

Editorial Division.

Up to the time hostilities ceased there was so pronounced a shortage in incoming reports from the bureau's field staff that for a time the editorial division seemed confronted with the inevitable necessity of reducing the size of Commerce Reports. But within a month after the armistice was signed there were so many reports in hand that the facilities of the division and of the entire bureau were taxed to give them proper distribution.

The work performed in the division during the year amounted to approximately 12,800 printed pages, as compared with 10,872 pages during the preceding year. Fourteen monographs were prepared for publication in the Special Agents Series and 12 in the Miscellaneous Series. The number of pages in Commerce Reports jumped from 4,912 in 1918 to 5,760 in 1919, the increase occurring during the last six months. The number of foreign-trade oppor-

tunities published in this daily paper increased from 806 for the first six months of the fiscal year 1919 to 1,897 for the six months just closing. An increase of more than a thousand in the paid circulation of the paper has also taken place.

A new series of publications, designated Industrial Standards which will give substantial aid in trade promotion with Latin America, made excellent progress during the year. The first 62 numbers in the series have been issued. They are bilingual editions, in Spanish and English, of standard specifications of the American Society for Testing Materials. This work will be continued during the current year by the translation of these specifications into French and the publication of French-English editions for distribution in the several countries of Europe where that language is used. It is also planned to publish a bilingual edition, in French and English, of the Standardization Rules of the American Institute of Electrical Engineers.

Recommendations.

1. The commercial-attaché service has, during the four years that it has been established, amply proved its value. There has been a distinct field to be filled by men with broad economic and business training devoting their entire time to the important problem of promoting American commerce abroad. Commercial attachés have in almost every instance been of continued assistance to the embassies and legations to which they have been attached, because important commercial questions have been constantly coming up where the advice and assistance of a trained man were of great value. It can further be said that commercial attachés have constantly been of assistance to other departments of our Government which have sent important official representatives abroad. Commercial attachés have turned their hands to whatever task of a commercial character was at hand to do. At the same time constant assistance has been given to visiting American business men who have been endeavoring to enter new markets and to organize their business along sound lines. The commercial attaché has been a commercial counselor of high grade whose service has been found so useful that his time and energy have been taxed to the utmost. It is in accordance with proved usefulness that I strongly recommend the extension and improvement of this service. The kind of men who are useful for this work can obtain large salaries in the employ of American companies engaged in export business, as evidenced by the fact that

commercial attachés have been lost again and again on this account. After an official of this class has the advantage of several years' experience it is a distinct loss to the Government to have him leave and to have to put in a new man. The responsible nature of the commercial attaché's work and the high-grade men required make it necessary to pay higher salaries than we have been able to do. It is also necessary to provide more clerical assistance than has been permitted under the organic law. I recommend substantial increase in the appropriation for the commercial-attaché service.

2. Under the general head of "Promoting commerce" come the special investigations made by trade commissioners, the functions of the district offices, and other work of similar character. It has been possible to obtain high-grade specialists to make investigations in specific lines. Reports and monographs which have been published at regular intervals have been utilized to a great extent by the different trades. This is a work which I feel should be continued. The district offices, established in principal cities, have come to be focal points for foreign-trade information and have done splendid work in making available a large amount of commercial information received from American representatives abroad. These offices are in need of larger staffs and higher salaries. Again and again district office managers who have done excellent work have been given positions with private firms at higher salaries.

3. The Latin American, Far Eastern, and Russian divisions have coordinated commercial information relating to their respective territories and have made it available to American exporters. This specialized service has met with an excellent response. It is a kind of work which I believe should be extended.

4. It is important that the Bureau of Foreign and Domestic Commerce should have an adequate sum for post allowances to be granted to its representatives abroad to offset unusual high cost of living charges and uncertain conditions prevailing at the present time in different countries. The wisdom of granting post allowances has been demonstrated in the case of the American diplomatic and consular service under the Department of State.

5. The Bureau of Foreign and Domestic Commerce distributes to the American business public not only information received from its own representatives abroad but also a large amount of valuable commercial intelligence which comes in from American diplomatic and consular officers. During the present period of

international trade adjustment it is important to have frequent reports to indicate changes which are constantly occurring. This current commercial information should be transmitted to interested American exporters without delay. The statutory staff of the Bureau of Foreign and Domestic Commerce is the medium through which this information must pass. With an unprecedented amount of valuable information to distribute and a greatly increased demand on the part of the public for information of this character, the strain placed upon the statutory staff of the bureau has been very great. It is necessary to have an increased clerical force and also added provision for competent administrative officers. The salaries in the bureau in Washington have not been sufficient to hold highly trained men, who have left the service to enter private employment.

6. The international trade situation is to-day a matter of vital importance to the prosperity of this country. It is essential that the most authentic information about foreign markets be obtained and distributed. In order to do this work effectively, sound constructive plans should be made. Men trained in foreign investigation and in the analysis of foreign-trade conditions are to-day in very great demand in private business. The Bureau of Foreign and Domestic Commerce has been to a considerable extent a training school for men who have later obtained important positions with private companies. It is my opinion that the time has come when sufficient means should be provided so that the foreign-trade service of our Government, represented by the Bureau of Foreign and Domestic Commerce, may be placed on some permanent self-supporting basis, so that accumulated experience may be retained. The service of the Bureau of Foreign and Domestic Commerce deserves to be given increased appropriations necessary to enable it to carry on successfully the valuable work which it is attempting to do.

NATIONAL BUREAU OF STANDARDS.

(Dr. S. W. STRATTON, *Director*.)

The National Bureau of Standards is organized in nine scientific and technical divisions, the office, the mechanical plant, and the technical shops—88 separate sections in all. The bureau's staff during the year included 1,150 employees. The scientific library has 17742, volumes, chiefly in physics, chemistry, and the special technologies, and 442 scientific periodicals from all parts of the world are currently received. There are 13 principal laboratory

buildings, connected by service tunnels, and the equipment includes a liquid-air plant, a refrigeration system, power plant, gas and electric generators, and a system of technical services, such as time signals, electric current, gas, steam, compressed air, vacuum refrigerating brine, and others which are connected to the various laboratories. The bureau also has woodworking shops, instrument shops, a glass-blowing and a glassworking shop, and a well-equipped photographic laboratory.

The transition from war to peace brought special problems of reconstruction of work in the face of reduced funds, and many resignations, aggregating 378 (exclusive of 1,127 separations of a temporary character). To maintain the staff, 1,909 appointments were made. Certain military researches were continued because of their permanent value to the Army and Navy. Researches for other departments and for the industries—deferred somewhat during the war—were resumed, and peace programs of industrial research were taken up vigorously. Estimates were submitted to Congress for this industrial work.

The scientific and technical knowledge derived from researches and investigations is disseminated through printed publications, 51 of which were issued during the year, comprising 36 new issues (12 scientific papers, 15 technologic papers, 6 circulars, and 3 miscellaneous publications) and 15 revised editions. A descriptive list of publications was issued, in which there is given a brief technical abstract with each title, which, with a subject index, makes it specially useful to experts interested in any of the bureau's varied fields of work. In addition, the bureau issues a series of monthly technical news bulletins, in which during the past year 426 separate topics were treated, thus giving promptly summary news notes of the bureau's researches. An important function of the bureau is to make quickly accessible the results of new scientific researches.

Weights and Measures.

During the year, in its new circular on the measurement of mass, the bureau announced new standards of construction and accuracy for weights. This type of service in the interest of national uniformity is of great value to science and industry. The bureau also certified weights, giving corrections for each, so that fairly accurate weights may give very accurate results when the certified corrections are applied.

In the bureau's weighing laboratory 2,594 weights and 36 balances were standardized. Many interesting problems were handled, new methods of determining the weight of a bushel of wheat from samples, verification of standard grain testers, errors in weights caused by brittle lacquer, and the discovery that atmospheric humidity seriously affected the behavior of the bureau's new precision balance for assay weights.

In a larger way the bureau standardized mine scales and railroad track scales, using its traveling test cars, each equipped with weights totaling 100,000 pounds. During the year bureau experts inspected mine scales in Ohio, West Virginia, Kentucky, and Maryland, where bad conditions were investigated and rectified. The necessity of regular testing was clearly proven, the State mining laws were clarified on the points involved, effective safeguards assured, and the suspicions and discontent of the miners allayed. In all 352 railroad track scales were tested by the bureau in 33 States of the Union on behalf of the U. S. Railroad Administration, including 10 master scales used as standards to check locally the weights of the railroad's track-scale test cars. The results of the bureau's work are being incorporated in standard specifications for railroad track scales, prepared in cooperation with the technical interests concerned. These will promote efficiency and accuracy in large scale weighings on railroads, the importance of which may be gauged by the freight revenues collected on the readings of railroad track scales amounting to several billion dollars in a year.

The Twelfth Annual Conference on Weights and Measures at the Bureau of Standards, attended by 180 experts and delegates representing 29 States, adopted specifications for gasoline-measuring pumps, recommended that the bureau be empowered to pass upon types of measuring devices, approved the decimal flour bill, favored the sale of dry commodities by weight, the marking of net weight on wrapped meats, standardization of packages, and advocated the adoption of the international metric system of weights and measures.

The bureau has formulated model State laws, held conferences on the technical details of inspection service, and consulted State and local officials on technical legislation. Much of the new legislation is developed with the cooperation of the bureau. Several States, notably Texas, North Dakota, and South Dakota, have just enacted laws establishing State-wide inspection services for

the first time. Many States ask aid in establishing State departments of weights and measures, in field investigation, and in deciding the fitness of measuring devices. Specific aid was given Maine and Texas where new laws provide that after July 1, 1920, no weighing or measuring apparatus may be sold unless it is approved by the Bureau of Standards. These actions emphasize the need of a similar national law.

The bureau's length laboratory is the agency for the basic control of all length measurements and all measures derived therefrom. The distribution of accuracy in length is mainly through the standardization of the manufacturers' standards, which control output, and through the standardization of the State standard by which local inspection is regulated.

The bureau also devised means to measure the thickness of paint films—a problem of protection of ordnance shells, the paint film on which must be thick enough to protect and thin enough to avoid rubbing when fired. Methods were also developed to measure, with a high degree of accuracy, the celluloid photorecords of gunfiring. The wide range of technical uses of sieves in industrial laboratories and the great importance of fineness determinations led the bureau to a scientific study of the whole subject which has resulted in a revised scale of sieve sizes.

No length measures are more interesting than the modern precision gauge blocks by which the dimensional accuracy of tools, machines, and countless other factory products is assured. The bureau's successful development and production of gauges, which excel by 100 per cent the quality and accuracy of the best imported gauges, is now well known. The high precision of these gauges is controlled by the direct use of waves of light to measure the errors, some of them less than one-millionth of an inch. The Government was unable to obtain the needed gauges of this type from foreign makers during the war. It is interesting and significant that the bureau was able to develop the methods and make up enough gauges to supply the Government need at a total cost less than the market value of the imported gauges needed at the outset.

The bureau conducted courses of instruction in measurement and in the use of the bureau's special gauge-testing apparatus and methods in field work. The courses were attended by Government supervisors and inspectors from both War and Navy Departments and from manufacturers of munitions and military material.

Valuable work of the highest precision attainable is being done on the measurement of the expansion of materials with temperature. Two examples of the 121 tests made will illustrate. The bureau developed a new type of porcelain for use in spark plugs of motors. To prevent cracking at the high heats encountered, the expansion of spark-plug porcelain in service should be exactly the same as that of the metal electrodes used in producing the spark. So, too, dental filling amalgams must be "balanced"; that is, made up to expand equally with the teeth. The measurement of the minute changes of size involved required optical methods, the expansion being measured by the use of light waves. As a result of this work, specifications will be drawn up for these materials by the bureau in cooperation with the research institute of the National Dental Association.

The need for the bureau's work in standardizing capacity measures for technical uses is shown by the fact that only two-thirds of the volumetric apparatus tested by the bureau during the year passed the test. These measures included burettes, cylindrical graduates, dilution pipettes, transfer and measuring pipettes, and flasks. One-sixth of the density-measuring devices, hydrometers, salinometers, etc., were rejected. In addition to the testing of gas-meter provers, the bureau made an inspection of 103 large natural-gas meters used in supplying towns with natural gas, and disclosed the fact that several million dollars' worth of gas is being lost in a year by leakage in the distributing systems.

The Government shipbuilding program involves, among other things, a continuance of the testing of special timepieces for the new ships. In the time laboratory nearly 10,000 timepieces were tested, ranging from 12 minutes for stop watches to 100 days for master-clock systems. Class A certificates were given for 19 out of 82 watches tested. The system for testing is thoroughly established and the fundamental time indications of the Riefler standard clock of the bureau is maintained with a constancy within a small fraction of a second a month.

Electricity.

Electrical science and industry depend upon the bureau's fundamental standards for uniformity in the electrical measures and data which are the basis of all electrical work. These standards are applied to the industries largely through the makers of electrical measuring instruments and appliances. The manu-

facturers' standards are checked up at the bureau, thus assuring nation-wide uniformity at the source.

The bureau's electrical testing for the industries keeps it in close touch with industrial needs, and its testing for the Government assures suitable quality of delivered supplies and yields data needed by the bureau for perfecting standards of quality and performance. Such standards gather up new scientific results and service experience and apply them in the industries through the specifications for supplies and equipment, and thus become an agency for stimulating industrial progress.

The electrical laboratories cover work in photometry, radio communication, X ray and radium, and public utilities.

The bureau's researches in the war involving electrical principles covered many subjects—the location of enemy batteries by means of sound-recording mechanisms, the electrical control of airplane guns to fire between the propeller blades, time studies of gunfiring, variation of gun pressures, ejection-velocity studies by recoil meters, the development of kinemometers to measure the jumps and whip of a gun on firing, the measurement of projectile velocities inside the gun, and scientific studies of the gun blast. A special investigation of battleship-turret firing was made and the firing circuits greatly improved. From experimental work and the theoretical studies involved the bureau was enabled to develop numerous new devices and methods of measurement applied to artillery problems. The bureau's technical resources and ingenuity were applied to perfecting the plans of experiment and the devices themselves. The results in actual practice have been gratifying. A bureau expert was sent to France and England to further study the problems of gunfiring, and the basis for new and important work has been thus established. Other electrical military work included the investigation of technical methods of protecting ships against mines, the measurement of speed of bullets fired by centrifugal guns, and a large amount of technical consultation work on electricity applied to warfare. A recent report of the War Department announced that the latest sound-ranging system developed at the Bureau of Standards for the location of enemy batteries proved to be superior to all such systems in use when the armistice was signed.

An electrical method was also developed for measuring the velocity of flame propagation in the cylinders of internal-combustion engines. This is a contribution to the general problem of automotive power plants, the full program for which is being

vigorously taken up by the power-plant laboratory of the bureau. The electrical principles involved in the design of spark plugs, magnetos, and complete ignition systems are carefully studied. It is of interest to note that in connection with the investigation of the design of this new spark plug, the bureau's ceramics staff developed a new type of porcelain, having the electrical and thermal properties required.

The war made necessary the standardization of military supplies. The bureau's cooperation was sought, and some of its experts gave their full time for several months with a highly gratifying result. In fact, the success opened up the subject of standardization on a much broader scale, and, especially in connection with the electrical supplies and equipment, a most thorough standardization was completed. The results are embodied in the new catalogues of military supplies.

A valuable standardization work was the development of standards of quality and performance for electric dry cells. The vast number of these cells used throughout the country and by the Army and Navy made the subject one of considerable economic importance. The investigation was successfully completed and the results embodied in a published circular giving the specifications for and methods of testing dry cells. A similar work on storage batteries is well under way.

The bureau developed a method by which aviators may land in the fog or dark. The system involves the use of automatic radio signaling equipment on the landing field in combination with suitably designed direction finders on the airplane. Practical trials proved entirely successful. The development was undertaken for the Air Mail Service. A landing field was equipped for the purpose. Automatic signals are encountered by the airplane as high as 6,000 feet from the ground, and with the direction finder the aviator locates his position with respect to the ground and descends safely in fog or darkness. The bureau also developed and successfully applied the most successful submarine radio system, making possible signaling from a submerged submarine for a distance of 12 miles and the receiving of signals transmitted thousands of miles exactly as when received in the air. This work involved the development of a satisfactory direction finder for use under water.

The bureau has rendered special service to radio communication in connection with the so-called "electron tube," sometimes called by the more general name "vacuum tube." The new

electron tubes have revolutionized methods of radio communication since the outbreak of the war. The development has been so rapid that it became necessary to completely standardize electron tubes, so that their performance could be predicted in every essential respect. This theory was worked out, and the methods developed are described in a bureau publication now in press. Radio-research headquarters for the Army and Navy radio service are located in the laboratories of the Bureau of Standards, and there has been most cordial and complete cooperation between the Bureau of Standards, the Navy, and the War Department experts.

Public Utilities.

The standards for public utilities developed by the bureau relate especially to electric light and power, gas, street-railway, telephone service, and miscellaneous industrial utilities. The bureau conducts scientific and engineering research, studies the public-relations question, prepares specifications for the quality of such service, outlines methods of testing and inspection, formulates safety rules to safeguard the employees and the public, and collates and distributes information impartially to all concerned. Public-utility standards are based upon standards of measure, quality, and performance, and embody in numerical terms the ranges of the pertinent factors defining quality, safety, economy, convenience, and efficiency. Owing to the unusual conditions, the public-utility staff of the bureau during the past two years has been called upon for an unprecedented amount of work. The bureau attained an enviable position as an impartial referee in such subjects and settled disputed questions on a scientific basis. The work has been especially fruitful in assuring to the public a means of specifying adequacy and safety in the production and distribution of electric power, gas, and other forms of service.

The bureau's gas-service standards have proved of great usefulness. Cooperative investigations have been made on behalf of State and local public-service commissions in several States and for many cities. On behalf of the State commission for Indiana cooperative tests at coal-gas plants in the State resulted in new features of gas standards fully set forth in the bureau's report—the most complete and convincing effort ever made on behalf of a public-service commission to determine the best requirements for a State. The data will be valuable to the gas industry.

The bureau's investigation of an industrial-gas enterprise in Maryland resulted in technical recommendations to the management which will "ultimately turn a loss into a substantial profit." The bureau's staff visited 14 different localities, in addition to supplying many requests for information by correspondence and in conference. Much valuable data were made available for the gas companies and the municipalities on matters of controversy or public agitation.

The bureau's standards for electrical safety service are being revised on the basis of experience. In this work the bureau has had the cordial cooperation of public-service commissions, municipalities, and public-service corporations, as well as of national technical societies and individual experts interested in the production and use of electricity.

A new publication is now in preparation which will give the bureau's new "Standards for street lighting service." The experimental and field investigations of street lighting upon which these standards are based, comprised inspections of municipal and private plants, the direct measurements of street lights, and conferences with illuminating engineers and plant managers. Somewhat new in kind is the bureau's study of standards for central station, hot-water heating service undertaken for the State of Indiana. Technical rules covering the factors of adequacy and safety of such service formulated by the bureau were adopted substantially as recommended. These standards are included in a circular on "Standards for steam and hot-water service" now nearly completed.

Telephone service standards are of nation-wide importance, and the bureau is preparing two publications on the subject. The bureau gathers technical data for impartial dissemination to the telephone industry, to regulatory commissions, and to the telephone-using public. One new circular will give an account of the modern telephone service, and a second will describe in detail the service in selected cities. The bureau assisted in standardizing and defining the technical terms employed in telephony in America and Great Britain.

Standards of safety have engaged the earnest attention of the bureau's staff with a view to reducing life and property hazards arising from the use of electricity and from general industrial processes.

The Electrical Safety Code, of which a new edition is now in preparation, has been adopted by at least 20 administrative

bodies throughout the country and recommended for use by many others. In several States, notably Pennsylvania, Wisconsin, and Montana, this code is now mandatory. It has been voluntarily adopted by a large number of industrial concerns and, in general, has met with nation-wide approval.

There was held at the Bureau of Standards a conference on industrial safety codes which was attended by more than 100 representatives of different interested organizations. The conference agreed that the Bureau of Standards should lead in the work, and plans are now under way to arrange the most effective cooperation in the preparation of industrial safety codes. The bureau has already prepared a number of such codes, namely, National Elevator Safety Code, National Code for Safeguarding Machines and Machine Drives, National Code for the Protection of Head and Eyes of Industrial Workers, and National Code for Safeguarding Remote Control Apparatus.

The bureau's technical investigation of the damage to structures by stray electric currents from street mains has resulted in the development of standard electrolysis surveys and standard procedure for electrolysis mitigation. Solutions were recently arrived at in several cities in Missouri, Ohio, and Indiana. New apparatus for use in electrolysis surveys has been designed, constructed, and tested at the bureau. The results are so satisfactory that they will be applied to the bureau's field work during the next few months.

Radium.

The importance of radium in surgery and in dermatology has caused a rapid growth in the bureau's testing-of-radium preparations, 474 of which were tested during the year, containing a total of 13,159 milligrams, having a market value of \$1,500,000. These specimens were certified about equally for the military departments, for commercial export, and for domestic use.

An important use of radium salts is in the self-luminous paints for marking watch dials and other objects.

The modern use of such materials containing radium salts has rapidly developed. The demand for their standardization resulted in the bureau's taking up the work at the request of the Army and Navy. The bureau furnished information concerning the properties of luminous materials, methods of measuring their brightness, estimates of cost of preparation of apparatus and supplies for factory inspection of the dials, extended study of selected speci-

mens by experiment, and the preparation of models. In this work the bureau has had the most cordial cooperation of the manufacturers and civilian users. Much information is included in a circular on "Self-luminous materials," prepared by the bureau for early publication.

Heat.

The measured control of temperature is a vital factor in many industries. The Bureau of Standards maintains the standard temperature scale for the country, conducts researches in heat and temperature measurements, the measuring apparatus used, and distributes samples of standard pure metals having certified melting points, and of standard materials having certified combustion heat values. These certified materials are used locally to standardize the heat and temperature measuring apparatus in industrial laboratories for the control of processes of production. During the past year 20,000 thermometers and other heat-measuring devices were tested and certified in the bureau's laboratories. The heat division also serves as a national bureau of information on temperature and heat measurements; hundreds of letters and scores of visiting experts have called for a wide range of data needed in the conduct of industrial researches or in the control of industrial processes.

The maintenance of the fundamental temperature scale requires elaborate researches and exacting experimental work. The scales are fixed by the melting and boiling points of metals and other materials, the basic 100° interval lying between the freezing and boiling points of water. A type of research required is illustrated in a paper, published during the year, on the standardization of the sulphur boiling point, one of the fixed points of the temperature scale. To secure constancy of indication of this boiling point, specific experimental conditions must be carefully observed. Similar precautions must be adopted in all other fixed-point determinations. A new thermometer comparator was devised in which melted metal secures the needed temperature uniformity.

Success in producing high-quality optical glass depends upon the removal of internal strains by effective annealing methods. The heat experts of the bureau recently developed methods for such annealing and for determining by simple tests the practical temperatures required and procedure to be followed. The time-temperature curves for producing ovens were worked out by bureau heat experts for two leading types of coke ovens. The

determination of the properties of ammonia now completed supplies refrigeration engineers for the first time with complete and reliable data on this important material, for the calculation of tables covering ranges from -75° to $+70^{\circ}$ in place of the meager data previously available.

During the year 106 structural columns were tested in the systematic program of investigations on the fire-resistive properties of structural materials to furnish needed basic data as to materials commonly used in buildings under fire conditions. Fire tests were followed by water application to determine the final resistance of the columns to fire and their action when suddenly cooled by hose streams. The resulting data are the most comprehensive ever available. Unprotected steel was found to sustain loads for less than a half hour, concrete columns for over eight hours. Duplicate tests checked within 10 or 20 per cent. The bureau also cooperated in fire-safety work and in the movement for fire protection and prevention. Special conferences were held on the hazards in cotton ginning, fertilizer handling, petroleum shipping, pyroxylin plastics, including motion-picture films.

The Bureau of Standards has the only "altitude laboratory" in the country. This is a small room which may be made airtight and the air partially removed to produce the low pressures encountered at high altitudes. The laboratory and results obtained have been described in four published reports. The engine to be tested is operated in the room and is supplied with cold air at temperatures actually encountered at any altitude desired. Aviation engines of several types, including the "Liberty 12," have thus been tested at simulated altitudes of 30,000 feet under the most scientific observation and measurement.

The new "altitude laboratory," now nearly completed, will furnish ampler space and exceptional facilities for testing internal-combustion engines for automotive purposes. Scientific studies on basic problems are in progress; for example, on the rate of flame propagation in a gas-engine cylinder and on pressure cycles, carburetion, ignition, lubrication, etc. The work is a splendid example of technology developed during the war and adapted almost without change to important industrial uses.

A series of informal bulletins were issued to disseminate the results of the bureau's engine researches. Seven such bulletins treated of spark-plug problems, seven of engine radiators, and other reports will appear in the next volume of the proceedings of the National Advisory Committee for Aeronautics. The demand

for the bureau's tables of melting points of the chemical elements exhausted the edition, and a more complete edition, recently prepared, completes the present data on fixed temperatures. The bureau has published a number of scientific papers on high temperature subjects; e. g., optical methods of temperature measurements above $1,500^{\circ}$ centigrade; recording pyrometry for use where a printed record is useful; automatic control of high temperatures by which, for example, the supply of fuel is automatically varied to maintain the furnace at any desired temperature. Serious losses entailed by furnace failures make a recent paper on the melting points of refractory materials a timely contribution to industrial economy.

History of the Production of Optical Glass by the Bureau of Standards.

The removal, now in progress, of the optical-glass plant from Pittsburgh to Washington closes the first period of its history. A brief résumé of its work follows:

For some time prior to 1914, the bureau had felt the necessity of the United States shaking off the yoke of complete dependence on Europe for its optical glass. European manufacturers had so carefully guarded the secrets of their technique that the necessary preliminary investigations were far too extensive and too expensive to expect commercial corporations to undertake the pioneer work. With this object in view, a scientific expert, with a knowledge of glass making, was appointed in July, 1914, to take up experimental investigation of the production of optical glass. He was not an expert in optical glass, however, for there were none in this country at that time. The necessary preliminaries had been completed by December, 1914, is shown by a report of three "runs of optical glass" for that month.

In 1915, 76 melts and 54 pots were made, a new furnace built, 3 different types of optical glass produced, and some annealing experiments carried out.

The new developments of 1916 included the building of a three-chamber furnace, comparative corrosion tests of the molten glass on pots made of domestic and imported clays, the production of a "very satisfactory" new mixture for pots, and, finally, a batch of borosilicate glass, free from striæ, although not entirely free from bubbles.

The investigations of 1917 brought out the fact that the poor melts were largely due to unsatisfactory pots. So, the solution

of this problem was attacked with increased vigor, resulting in one of the most important steps forward in the history of glass production anywhere; i. e., the casting of pots instead of making them by hand. This method greatly reduces the difficulty, the time, and the cost of making the pots. Those obtained on the market were strongly attacked, especially by the barium glasses, sometimes being eaten entirely through by the molten glass, with the result, of course, that the glass mixture was both impure and discolored.

When this country entered the war in April, 1917, the bureau had made over *one hundred* melts of glass and nearly that many pots.

Furthermore, it was *at that time* making melts of the important borosilicate and barium crown glasses on a commercial scale. In November, 1917, 16 melts of 600 pounds each were reported and shipments to the factories made. From then on regular shipments continued, that one in the month preceding the armistice being recorded as 3,021 pounds of first-grade binocular glass, representing more than 15,000 pounds of glass actually produced.

True to the original object in view, the bureau, in addition to the production of considerable optical glass for military purposes, has at all times given freely all possible assistance to those engaged in the manufacture of glass. They have frequently consulted its experts as to methods of manipulation, materials, and the manufacture of pots. Conferences have been held at the bureau and its experts sent to the factories when requested. These efforts have been cordially received and appreciated, as shown at one of the meetings of the optical-glass section of the War Industries Board, where the president of a large glass corporation stipulated that they would take up the production of optical glass for one of the entente nations provided the Bureau of Standards would send experts to the factory to lend technical help.

Light.

The bureau develops light standards, instruments, and methods for measuring light illumination, and determines the optical properties of materials and optical instruments. The precise measurement of light waves, apparently of purely scientific interest, proved to be of the utmost practical value during the war, since light waves were used by the bureau to control the accuracy of the master gauges used in the manufacture of munitions.

The bureau continued the precise measuring of standard wave lengths of selected radiation of the various chemical elements. Special experience and facilities in red and infra-red photography enabled it to do useful work in this field of radiation in the study of solar radiations which could not be photographed heretofore nor observed visually. The bureau's recent spectrographs of the sun in the red and the invisible radiation beyond the red proved the presence in the sun of 27 known elements. In the red-region radiation, or spectra, 8 metals and 2 rare gases were examined, new work nearly completed on 10 other elemental metals, and work on rare earth elements begun.

The bureau has had success in photographing through light fogs or haze. Color screens to cut off the characteristic light of the haze in combination with red, sensitized photoplates enable the plate to record only the light from the landscape behind the haze. The pinacyanol-stained plates proved four times faster than the best commercial panchromatic plates in use. New and important fields of optical research are thus opened in photography which will demand the design of new lenses adapted to red light, the study of radiation reflection by landscapes, and special studies of sensitizing dyes.

Color standards and methods of color measurements are now being placed on an excellent scientific basis. The bureau proposes, in certain cases, to discontinue color grading in terms of material color standards which are difficult to obtain, duplicate, or certify accurately. The new method is to determine the color transmission of light of a definite wave length. This gives an essential property of the material itself independent of the color vision of the observer. The observation easily made in reproducible units eliminates arbitrary, ill-defined standards. Systematic color standards and measurements are of interest in many industries—paints, dyes, inks, textiles, paper, flour, soap, tobacco, butter, and other products—all make the field one of much commercial and economic value. The special work of the year included the color grading of papers, pyralin ivory, cottonseed oil, and other materials. The terms used in colorimetry need standardization, and the bureau has aided in systematizing not only the nomenclature, but the units, standards, and symbols.

At the request of the eye-hygiene committee of the American Medical Association, the bureau is investigating various glasses now on the market purporting to suppress harmful radiations.

A technologic paper was prepared on the basis of tests of 82 samples of eye-protective glasses now on the American market. With this data, oculists or buyers may now prescribe or order glasses having any desired color transmission, acceptance being based upon color tests.

Research on quartz resulted in a new means of fixing one point on the high-temperature scale in a region not otherwise well defined; i. e., $573^{\circ}.3$. A very sudden change occurs in the optical properties of quartz, the sharpness of which makes it suitable for the purpose. The action of quartz in twisting the direction of vibration of light waves is known as polarization. This is the basis of polarimetry. The subject has a high theoretical value in physics and many practical uses; e. g., it is the practical basis of sugar testing. Sugar technology is based upon the readings of the polarimeter, which indicate the percentage of pure sugar in a raw sample. The bureau standardizes the quartz plates, instruments, and accessories used, and a new fund granted by Congress has recently given special impetus to the work, which is proceeding vigorously in cooperation with sugar technologists and the sugar industry.

The distribution of the bureau's standard samples of highly purified sugar for verifying polarimeters is an important means of technical control in the industry. The optical analysis of sugars at the bureau has been a useful service to the industry and in the control of the precision of sugar analyses of imported sugar for the Customs Service.

The Medical Service of the War Department requested the bureau's aid in producing certain rare sugars, about 25 in number. The bureau has tested a number of these by methods devised by careful research. The insistent demands for these rare sugars has led the bureau to study the sources and production. These sugars range in value from a few dollars to several hundred dollars a pound. The bureau has already developed successful methods for producing pure, white crystals of the so-called d'mannite sugar by double crystallization from the crude manna and at a reasonable cost.

An example of the use of abstract physics for practical purposes is the use of interference of light waves in studying the behavior of the porcelains and amalgams used to fill teeth. The bureau has for some time been investigating the expansion of such materials when exposed to changes of temperature. This calls for exact measurements of the expansion of these materials when heated.

Light waves and the phenomenon of interference are used to measure this expansion with great precision. These dental materials were found to expand four times as much as the natural teeth themselves. The data will aid in the development of more perfect filling materials for the teeth.

The bureau designed and constructed or cooperated in the development of many military optical devices. It designed a spotting camera, for example, and redesigned a triangulation camera for the Navy. The spotting camera complete with a manual of instructions was turned over to the military authorities, and the triangulation camera is now completed. The bureau designed another camera for the panoramic photographing of the inside of a machine-gun barrel. Related work included a night-firing device, a marine position finder, a tank sight, a 37-millimeter gun sight, a periscope alidade, Army binoculars, and many other instruments. The bureau also tested 2,000 binoculars, 54 lens systems, 436 samples of optical glass, and made 111 tests of miscellaneous optical devices.

Radiometry comprises the field of visible and invisible radiation. The work is mainly experimental and theoretical, but its immediate application to the industries is both direct, interesting, and important; for example, in high-temperature measurements and researches on efficiencies of light sources. The bureau's expert reported to a Government department that plain glass is as useful in greenhouses as the ribbed and hammered glasses sometimes considered for such purposes. A radiophonic system of secret signaling was developed by the use of the radiation properties of molybdenite. The sensitiveness of this material made it possible to secure a loud, musical sound by the invisible radiation of wave lengths longer than red light. A system of invisible light signals was also developed, using the ultra-violet waves. Recent use of applied radiometry was made in connection with the glass roofs of balloon hangars. On request of the War Department, the bureau recommended a substitute for the special colored glasses designed to exclude the ultra-violet rays which have serious effect on balloon fabric. The bureau's advice was that they use asphaltum varnish on plain glass, which, of course, is much more economical.

Chemistry.

In addition to distinctly chemical standardization, chemistry is required in all fields of physical standardization. Many articles published on chemical subjects on work done at the bureau show

the variety of application of chemistry in physics and the special technologies. During the year, 18,436 chemical tests were made by the bureau, largely of materials purchased by the Government. Many researches were under way during the year, among which several examples may be cited. Pure materials and their uses form a series of standardization problems. The purification of mercury is now on a routine basis. Pure methane was produced for determining accurately its heat properties. Pure ethyl alcohol was prepared for use in measuring its density and other properties.

The bureau's electrochemical work included several useful researches, such as the lead plating of gas shells, black nickel plating for military equipment, and zinc plating to protect steel from corrosion. Gas chemistry has had at the bureau certain useful applications in aircraft. Balloon fabrics were tested for gas permeability and lasting qualities, and methods and instruments were developed for conducting such tests.

A new automatic gas-analysis apparatus, constructed at the bureau, is now in operation at the Government nitrate plant at Arlington. Apparatus was also constructed to record the amount of helium in preparing the gas for use in balloons, and a set is now under construction for the large helium plant of the War Department by which 12 simultaneous and continuous analyses of helium output are automatically made. The shortage of platinum during the war led the bureau to the study of platinum substitutes and certain alloys of gold containing palladium were found suitable for many chemical operations.

The bureau has continued its interest in standardizing reagents and in the proper labeling of chemical reagents, so that the serious difficulty attending their use by chemists may be reduced. The bureau has organized an interdepartmental committee on paint-specification standardization, and a conference was held at the bureau. The first results are embodied in the Standard Specifications for Linseed Oil, recently published by the bureau. A new edition of the circular on soaps was issued.

In addition, the bureau has continued technical analyses and chemical researches on a very wide range of materials.

Materials.

The bureau's work in materials includes a wide range of structural and miscellaneous materials, such as metals, cement, lime, paper, textiles, rubber, leather, oils, clay products, etc.

All cement used by the Government, by Executive order, must conform to the United States Government standard specifications for cement. The cement tested by the bureau covered shipments of 6,588,923 barrels, practically double that of the previous year, and 12 times the amount tested in the year 1916-17. The rejection of 10 per cent of the cement tested shows the need for such testing. Researches were made on the properties of cement and concrete, fineness of grinding, air analysis, standard cement sieves, volume changes in finished mortars and cements, concrete oil storage, waterproofing of concrete and stucco, and the acceleration of hardening of cement. The bureau's samples of finely ground cement of definite and certified fineness of grain enables the technical laboratories of the country to standardize their own sieves accurately.

The construction of concrete ships was initiated in the bureau's cement laboratory, the chief of which became the directing head of such construction. The bureau has since continued its technical cooperation with the Shipping Board in numerous ways. During the year, a study of the cement gun, by which the material is shot in place instead of being cast, was completed and reported upon. Improved methods were developed affecting the properties and ingredients of cement and concrete and the time of mixing. A useful improvement consisted in the use of paper molds in place of the steel molds hitherto used for casting concrete test cylinders.

Lime has commercial uses not only as a structural material, but in other industries. Standards of quality for lime are quite recent. In the work on lime the bureau has had the cordial cooperation of the National Lime Association and similar organizations, all of which have committees on cooperation with the bureau. Important researches under way during the year have included the compressive strength of cement and lime mortar, the effect of hydrated lime on the properties of cement, causes of "unsoundness" in lime plasters, and the measurement of plasticity. The bureau's methods developed for the study of plasters apply also to gypsum and other wall plasters.

Rubber has such varied and important uses that the bureau endeavors to handle basic problems of the physics and chemistry of rubber and develop methods of test. Methods of determining the ingredients have been developed, and many samples of manufactured rubber goods were analyzed during the year, including

balloon fabrics, rubber tires, rubber packing, hospital supplies, fire hose, and others. The bureau tested within a year samples representing the purchase of about 250,000 tires and established a local laboratory at one of the large rubber centers. Assistance was rendered to makers of solid-rubber tires in improving compounds used, and as a result a solid tire was developed which met all requirements. The possibilities of rubber research are as broad as the usefulness of the material. In the new quarters in the industrial laboratory it is expected that the work may be extended to include important and fundamental investigations.

The technology of leather is an important part of the bureau's work. A research completed during the year had to do with certain chemicals, including glucose and salts, which are put into the leather. The bureau is working in close cooperation with the 'Tanners' Council, the American Leather Research Laboratory, and the War Department. Special studies were made on sole leathers and on leather for shoe uppers to be used in the making of Army shoes, and also on the physical properties of harness leathers in connection with the stuffing material. Miscellaneous tests in the leather laboratory cover leather packings, water-proofed leather, and artificial leather.

The bureau cooperated in an advisory capacity in the development of specifications for leather for the General Supply Committee, the War Department, and the Panama Canal. Much progress may be expected during the coming fiscal year in this direction. In this connection, arrangements have been partially completed for installing an experimental tannery at the Bureau of Standards for use in leather research. The new laboratory provides ample space for extensive research and testing in accordance with an outlined program.

The Government uses approximately 50,000 tons of paper per year; this is bought on specification and tested at the Bureau of Standards. Five thousand samples were examined, of which 4,213 were for the Government, which included more than 19,000 separate tests. The bureau demonstrated that 700,000 bales of munitions linters left unused when the war closed could be used for the making of paper. Samples of paper were experimentally made on its paper mill to demonstrate that good paper could be made from such linters. As a demonstration, the programs of the annual convention of the Interstate Cotton Seed Crushers' Association of New Orleans were printed on paper manufactured at the bureau from cotton linters. About 700,000 bales per year are available for

paper making, and, if care is taken to keep the linters clean, a still larger amount can be utilized.

The physical, chemical, and microscopic testing of textiles is an important field of the work of the bureau which has had special value during the war in connection with Army uniforms, blankets, airplane and balloon fabrics, tent material, and other fabrics. The examination of English, French, and German fabrics showed that few of them were as good as the average of American manufacture. Woolen uniforms were examined for fastness of color, nature of dye, and the amount of cotton present. During the year an investigation has been in progress on sizing compounds for cotton yarns preliminary to the work on practical experiments in the bureau's cotton mill. In connection with airplane fabrics a study was made of stress in flight and new fabrics were designed and manufactured to improve serviceability. The increasing size of airplanes makes it important to have a stronger fabric. With the same object a tautness meter was designed and constructed at the bureau for the study of the wing fabrics in flight. Numerous readings taken on wing coverings of planes showed that tautness may be used to interpret the effects of humidity and temperature on the life of the fabric. With the occupancy of the new industrial laboratory, the textile section will have unusual equipment for research—a small felting unit, a complete unit of cotton machinery, and a similar outfit of woolen machines. These are of the latest manufactured design improved for the accurate requirements of laboratory work. One important object in view is the development of exact specifications for fabric, especially for the military departments. Such specifications will also be useful for other purposes, and the general results of the investigations will all be of service to the textile industry and the general public.

The testing-machine laboratory has continued a long list of useful investigations during the year, the tests numbering 3,000 in all. Some of these were extensive researches such as the test of a 150-ton floating crane for the Norfolk Navy Yard, the experimental study of electric welding for the Emergency Fleet Corporation, and technical investigations of motor-truck wheels and their behavior under stress.

Aeronautical Instruments.

Measuring instruments are vital to control in aviation, and the standardization of such instruments is of the utmost urgency.

The bureau reached mathematical solutions of the theory of such instruments, so that the results may be applied to particular cases. The failure of the metals used in the construction of aeronautic instruments to be perfectly elastic proved to be a critical source of error, and alloys were developed which are believed to be superior to the metals previously used. The bureau has tested 578 airplane instruments, completed researches on the errors of instruments, studied different types of tachometers, and determined the complete corrections for the barographs used in the flight which established the world's altitude record.

Members of the bureau's staff conducted flight tests of airplane instruments, making airplane flights in the dark to demonstrate a projection-type, night-altitude indicator. A series of high-altitude flights was made to study the oxygen-supply apparatus, the rate-of-climb indicators, the gyroscope, and other inclinometers. Tests were also made in flights across the English Channel and in the suburbs of Paris.

An interesting example of the bureau's work in technical education was the school of aeronautic instruments conducted for aviators. This included a three-weeks' lecture and laboratory course covering the theory and testing of aeronautical instruments. The data and other illustrative materials for similar courses were also furnished for the use of the Army.

Metals.

The metallurgical division of the bureau engages in fundamental researches affecting the improvement of metals, the development of new metals, and methods of avoiding metal failures and prolonging the useful life of metals and metal products. For this purpose, the bureau has a well-equipped experimental foundry, rolling mill, metallographic laboratory, heat-treatment laboratory, chemical laboratories, and a full equipment of electrical furnaces and pyrometers. The standardization of the purity, the composition, microstructure, and heat treatment are possible only through the measured control of all the factors, such as temperature, rates of heating and cooling, pouring temperatures, etc. Many practical problems of metal failures have been solved in the laboratory and a great amount of work done on improving the quality of metals by heat treatment and the standardization of pouring temperatures and finishing temperatures.

An important output of the metal laboratory consists of specifications for metals for special uses. During the war a series of

aircraft-materials standards were developed. In peace times the specifications cover the regular supplies needed by the Government departments, and special cases, such as statuary bronzes and metals for other special uses. Several cases of the bureau's aid to the metal industries will illustrate the work. Collapsible tin tubes are used for many classes of materials, and at the request of manufacturers of such tubes the bureau pointed out the several causes of defects. The behavior of aeronautic-pressure instruments depends upon the metal diaphragm. The success of several new alloys designed to correct the errors in such instruments depended upon proper annealing, for which suitable methods were developed by the metal experts. The bureau studied the deterioration of zinc-aluminum alloys used in die casting and reported upon the limitations of such material for this work. In another case the causes of certain defects in sterling-silver ware were pointed out after careful study of the ware. Manufacturers of razors and cutlery have recently requested the bureau to devise methods for measuring and defining the sharpness of fine cutting edges. Since this is practically a new field of standardization, there is little or no available or published experience to serve as a basis.

Changes in the rate of cooling observed in any metal are indications of quality and composition. The study of these is called "thermal analysis." An inexpensive method for such work was applied at the bureau during the year, a stop watch being substituted for the expensive chronograph usually used. Heat treatment is being examined with great care, and work is in active progress on a widely used structural alloy steel (containing $3\frac{1}{2}$ per cent nickel). The purpose is to correlate the properties with certain tests now made throughout the country. A detailed study of high-speed steels is being made to gain knowledge of their constitution and properties and to develop a method for comparing the relative value of two cutting steels. An important investigation is under way to find suitable steels and treatments for the same for use in making precision length gauges. The important factors in this work are the determination of the resistance to wear and deformation with time, the resistance to corrosion, soundness, expansibility, and economy under varying heat treatments.

Small amounts of gases like nitrogen, hydrogen, and carbon dioxide affect the breaking strength and other properties of metals. These questions must be attacked in a fundamental way, and the work in pure metals has this study as one of its

objects. Such pure metals are melted in vacuum furnaces, and the product is practically gas free. In the making of alloys uniformity is an important result to be attained, as segregation naturally is detrimental to the quality of the alloy. The bureau has conducted many studies of the "segregation" of the ingredients in the alloys. Work now in progress includes the preparation of electrolytic iron and melts or alloys prepared in vacuum, the making of pure aluminum, methods of determining gases in steel, deoxidizing agents for steel making, and the development of methods of steel analysis.

The bureau foundry is for experimental casting of metals and alloys and also is used practically as a commercial foundry supplying special castings for instrument parts required at the bureau and by other Government laboratories. This is one of the very few experimental foundries in the country, and it has many possibilities for service to industry. The work of the foundry included studies of Government bronze and its substitutes, studies of the relation of statuary bronzes to their weathering effects, efficiency studies of electric furnaces, investigation of light aluminum-casting alloys, and practical and experimental castings for laboratory use. An auxiliary investigation of molding sands of various types is of great importance to the foundry industry.

New Industrial Laboratory.

The branch laboratory of the bureau which has been maintained for some years at Pittsburgh, Pa., is to be discontinued and the equipment, staff, and work consolidated with the main laboratories of the bureau in Washington. On the completion of the new industrial laboratory designed to house this work, the installation began, and at this writing much of the equipment is transferred from Pittsburgh into the new quarters. In this connection, attention should be called to the excellent design of the new building and the unusual facilities which will be afforded for industrial research, facilities probably unexcelled in any laboratory. The facilities of the new laboratory include the full resources of the well developed and equipped laboratories of the scientific divisions, chemistry, heat, light, electricity, and the measures of length, mass, capacity, density, pressure, and time.

Ceramics.

Clay products form a whole group of useful and art industries, ranging from the crudest brick and tile to the finest porcelains used in the household, including the art porcelain ware, vases,

and other art products. The bureau's laboratories have been able to reproduce many of the finest qualities of foreign ware, both body and glaze. Chemical porcelain ware is a type of successful work accomplished. Much remains to be done in placing the clay-products' industries on a thoroughly scientific basis, but great progress has been made.

The refractory materials used in numerous industries have been the subject of investigation at the bureau and new substances having superior qualities have been developed. Several companies have undertaken to manufacture, for example, a new type of refractory proposed by the bureau last year, which combines light weight, porosity, good heat-insulating properties, and a high refractoriness, and is especially suited for use in marine boilers as furnace crowns, and for kiln blocks for terra cotta. The bureau has been able to produce pyrometer tubes more than 7 feet in length of American porcelains, similar to those imported from Germany before the war.

The investigations of hard-fire porcelains which have been under way for three years are nearly completed. The properties of more than 300 compositions have been studied to acquire the technical data needed in the industry. Several thousand pieces of tableware were glazed and fired. The results will shed much light on practical aspects of hard-fire porcelain manufacture.

Tiles used in wall construction were the subject of an important investigation by the bureau. The results of about 250 tests are published in a bureau technologic paper. The data will be valuable for the building industries. It is found that the source of the clay profoundly affects the clay behavior. The correlation data will be complete when the results of similar tests from other laboratories are assembled. Gratifying results were obtained in the study of architectural terra cotta. Much attention was paid to examining materials in actual buildings for various periods of time. Two striking types of failure were studied and accounted for. The laboratory work included absorption tests, artificial freezing, and strength determinations of terra cotta made from various clays largely used by manufacturers. The test pieces were burned at seven different temperatures. The resulting data will soon be announced in a final report covering all the work of the bureau on this building material.

Two technologic papers have been issued on the principles of iron enameling and researches are under way to solve problems met with in the manufacture of such materials.

The new industrial laboratory will give unusual facilities for the work in clay products. All of the contracts for the new kilns and furnaces have been let, the machinery has been purchased, and the installation of the equipment has been begun.

The Bureau and Industrial Progress.

The Bureau of Standards occupies a pivotal position in industrial reconstruction following the war. The great lesson of the war was that standardization was a first essential to efficient warfare. War industry differs from the industries of peace mainly in its urgency. The fundamental technical knowledge and requirements are similar. The military work of the Bureau of Standards during the war, therefore, will be of value to the industries during the critical days to come. The applications of science to industry are now recognized as of priceless value by the leading countries of the world. For this reason England, Australia, and Japan, among others, have on a new and large scale decided upon national programs of scientific research on the vital problems of industry. There is some danger lest we miss the full lesson of the war while other nations make prompt application.

Technical experts, societies, and the industries begin to realize the supreme importance of standardization, and the era of standardization may be said to have fairly begun. The bureau is represented on practically all of the great standardizing committees of the technical societies and is working in close cooperation with them. For the Government the bureau is a scientific advisor on the subject of standard specifications and has performed this service for practically every department and governmental agency, notably the War Department and the General Supply Committee.

In many cases the Bureau of Standards conducts fundamental researches in the laboratory on points which the specifications disclose. It is only by such research that it is possible to formulate standards of quality and performance of materials and appliances. The universal interest in standards reflects the growing appreciation of standardization as a means of industrial progress. The annual review of existing specifications for the purpose of incorporating new knowledge has had a most fruitful effect in stimulating the prompt application of new scientific knowledge.

It is doubtful whether there is another subject as fruitful of improved economy and efficiency as the standardization which is

basic to all industry. It is the standard of quality which determines the materials to be used, the form which they take, and the processes by which they are produced in the factory. It is also the standard of performance which is the user's ultimate test. In other words, standardization involves nothing less than the complete technical control of industry, by which is meant that modern industry must be based upon scientifically ascertained standards whether of measure, of quality, of performance, or of practice. From a national point of view, the work of the Bureau of Standards, therefore, is directed toward making itself as effective as possible in stimulating and in actively cooperating by research and investigation in all standardizing movements in which its cooperation is sought. The annual report of the Bureau of Standards shows many interesting examples of the variety and usefulness of this work.

BUREAU OF THE CENSUS.

(SAM. L. ROGERS, *Director.*)

The end of the fiscal year 1919 marked the close of the seven-year intercensal period during which the Bureau of the Census carried on numerous lines of statistical work at decennial, quinquennial, biennial, annual, quarterly, monthly, and semimonthly intervals, as prescribed by law; and on July 1, 1919, began the three-year decennial census period, within which time censuses of the population, agriculture, manufactures, mines and quarries, oil and gas wells, and forestry and forest products of the United States will be taken, compiled, and published.

During the fiscal year 1919 the Bureau of the Census carried on the compilation of the results of its quinquennial census of electrical industries; completed the work on its decennial inquiries relating to transportation by water and shipbuilding; brought well toward completion the preparation of its decennial report on religious bodies; completed and published a special report on marriage and divorce; conducted the regular annual inquiries relating to births, deaths, States, and municipalities; published quarterly statistics of stocks of leaf tobacco; made monthly and semimonthly collections and publications of statistics on cotton, cotton seed, and cotton-seed products; made special enumerations of the population in four counties; carried on the publication of weekly mortality reports for certain large cities; compiled statistics relating to the mortality from the influenza epidemic; performed a large amount of war work for other governmental establishments;

complied with numerous requests for information; and made detailed preparations for taking the Fourteenth (1920) Decennial Census.

The work done along the above lines during the fiscal year and since its close is described below.

CURRENT AND COMPLETED WORK ON STATUTORY INQUIRIES.

Electrical Industries.

This quinquennial inquiry, covering central light and power stations, electric railways, telephones and telegraphs, and municipal electric fire-alarm and police-patrol signaling systems, was made as of December 31, 1917.

The greater part of the data were obtained through correspondence, but it was necessary to send a number of men into the field to obtain information. The field canvass was begun in April, 1918, and was substantially completed in the following December.

Preliminary reports pertaining to the several inquiries covered by the canvass were prepared and issued. The final reports on telegraphs and on electric fire-alarm and police-patrol signaling systems were issued in the form of a single bulletin on July 19, 1919; and the work on the reports for the other inquiries is nearly completed.

Transportation by Water.

This decennial inquiry was made as of December 31, 1916. In order to avoid the disclosure of information of value to the enemy, the report was not made public during the war. After the signing of the armistice the report was completed and sent to the printer, and will be ready for distribution in the near future.

Shipbuilding.

Statistics for this industry were collected in connection with the last quinquennial census of manufactures, covering the calendar year 1914, and a further canvass was made in conjunction with the census of transportation by water, taken as of December 31, 1916. Although the results of these two investigations were compiled and the preparation of the combined report completed prior to the beginning of the fiscal year 1919, the same were withheld from publication because of the inadvisability of giving out the information during the war. The figures, however, were placed immediately at the disposal of the Shipping Board and other war agencies of the Government. In January, 1919, the manuscript was sent to the printer, and the report was issued, in bulletin form, on May 16, 1919.

Religious Bodies.

This decennial inquiry covered the calendar year 1916. The work was done almost entirely through correspondence. The preparation of the report was frequently interrupted by war work. On May 2, 1918, the bureau issued preliminary figures, subject to correction, showing the basic facts, and on January 17, 1919, a revision of the first statement was published presenting additional statistics. The complete report is being issued in the form of two bound volumes having a total of 1,318 pages.

Vital Statistics.

Births.—The “birth-registration area,” which, when established in 1915, comprised 10 States and the District of Columbia, approximately 31 per cent of the total population of the United States, grew rapidly, until in 1917 it embraced 20 States and the District of Columbia, about 53 per cent of the country’s population. No changes have been made since 1917. During the year 1919 tests were made in Illinois and Mississippi, but the birth registration in both States failed to measure up to the bureau’s standard of 90 per cent of completeness.

A press summary of the birth-statistics report for 1917 was issued in June, 1919, and work is progressing on the report for 1918.

Deaths.—The “death-registration area” now comprises 30 States, the Territory of Hawaii, the District of Columbia, and 23 cities in nonregistration States, and contains approximately four-fifths of the population of the United States. The most recent additions are Illinois and Louisiana, admitted for the year 1918, and Mississippi, admitted for 1919.

A press summary giving statistics of deaths covering the calendar year 1917 was issued June 25, 1919. The annual mortality report for 1917 has been completed.

Weekly Health Index.—The publication of the Weekly Health Index, inaugurated in October, 1917, giving mortality reports for 46 of the largest cities of the country, has been continued. During the epidemic of influenza and pneumonia, additional sheets were included, which gave the number of deaths resulting from those causes. Beginning with the issue for June 17, 1919, there have also been presented in each week’s issue statistics, obtained from the leading industrial insurance companies, showing number of policies in force, total number of death claims, and number of claims per 1,000 policies in force.

Need of Federal legislation providing for registration of births and deaths.—In the matter of birth and death registration the United States has not kept pace with many of the other countries of the world. This condition is due to the fact that registration has been left to the control of the State governments, many of which have failed to establish and maintain adequate systems of recording births and deaths. The practice of the Census Bureau is to admit to the birth-registration area those States, and to the death-registration area those States and those cities in nonregistration States, in which the bureau's tests indicate the registration to represent at least 90 per cent of all births, or of all deaths, as the case may be, if the registration systems justify the expectation of a more nearly complete registration in the future.

Thus far the only legislative action taken by the Federal Government toward the improvement of our vital statistics is found in a joint resolution of Congress, approved February 11, 1903, requesting the State authorities to cooperate with the Census Bureau in securing a uniform system of birth and death registration. The bureau has achieved some success in arousing the interest of the States in the matter. Under present conditions, however, it is likely to be many years before the last one of the 48 States enacts and properly administers adequate registration laws. It will thus be necessary, if the birth and mortality records of the country are to be reliable, permanent, and readily available for reference, to provide for a comprehensive system of Federal control and supervision.

Financial Statistics of Cities.

The report presenting financial statistics of cities having over 30,000 inhabitants, for the fiscal year 1918, has been completed. This report presents detailed statistics of revenues, expenditures, value of municipal properties, municipal indebtedness, assessments, and taxation; and also gives certain data relating to governmental organizations. The field and office work on the 1919 inquiry is now in progress, and it is expected that copy for the report will be sent to the printer early in 1920.

General Statistics of Cities.

In addition to its reports giving financial statistics of cities, the Census Bureau issues reports on various phases of municipal governmental activities, in addition to those pertaining to finances, under the title "General Statistics of Cities." For 1918 the sub-

ject covered under this head was municipal markets, and on July 23, 1919, the complete report was published in the form of a 56-page bulletin. The subject is a timely one, and the information presented will be of value to cities that are contemplating the establishing of municipal markets.

Financial Statistics of States.

The report presenting financial statistics of States for the fiscal year 1918 has been completed. This report follows closely the lines of those giving financial statistics of cities. Work on the inquiry for the fiscal year 1919 is now in progress, and it is expected that copy for the report will be ready for the printer early in 1920.

Cotton and Cotton Seed.

During the fiscal year the Bureau of the Census conducted its regular inquiries in regard to cotton and cotton seed. In addition to an annual bulletin on cotton production and distribution for the season of 1917-18 and a pamphlet giving complete statistics of cotton ginned from the crop of 1918, there were issued 10 reports relating to cotton ginned to specified dates during the ginning season; 12 reports, at monthly intervals, on cotton consumed, imported, exported, and on hand, and active consuming cotton spindles; and another monthly series relating to cotton seed received, crushed, and on hand, and cottonseed products manufactured, shipped out, and on hand. The pamphlet presenting the final figures on cotton ginned from the crop of 1918 (together with data for earlier years) was distributed in time to be of use in making comparisons between the ginnings from the crop of 1919 and those for corresponding periods in earlier years.

Stocks of Leaf Tobacco.

Four reports on stocks of leaf tobacco held by certain classes of manufacturers and dealers were published at intervals of three months. In addition, Bulletin 139, "Stocks of Leaf Tobacco: 1918," was prepared and distributed. This bulletin, which presents data contained in the quarterly reports, with comparative figures for earlier years and various other statistical information pertaining to the tobacco industry, is the second of an annual series designed to compile for ready reference the statistics of the various phases of the tobacco industry published by the several Federal bureaus.

Official Register.

Preparations were begun during the latter part of the year for the compilation of the July 1, 1919, edition of the Official Register of the United States, which consists mainly of a directory of Federal employees, showing name, designation, compensation, etc.

SPECIAL AND MISCELLANEOUS LINES OF WORK.**Marriage and Divorce.**

Marriage and divorce statistics for the calendar year 1916 were collected in 1917. At the close of the fiscal year 1918 the preparation of the report had been substantially finished. A press summary was issued March 20, and the report itself was published April 7, 1919. The work of compilation and preparation for printing was delayed somewhat by war conditions.

Special Censuses of Population.

Special censuses of the population of Okmulgee, Ottawa, and Tulsa Counties, Okla., were taken, at local request and expense, in August, 1918, December, 1918, and January, 1919, respectively. A special census of Charles County, Md., was taken in March, 1919, at the request of the Secretary of the Treasury, in order to determine the effect of the recent influenza epidemic therein. The work was done in cooperation with the Public Health Service.

Statistics of Fats and Oils.

In December, 1918, the monthly collection of data in regard to the production, consumption, and stocks of fats and oils was discontinued by the Food Administration. In view of the need for reliable information concerning these commodities during the reconstruction period, the Bureau of the Census was authorized to collect and publish, quarterly during the calendar year 1919, similar statistics. This work is now in progress.

United States Life Tables.

As stated in my last report, the bureau computed a series of "life tables" supplementary to the series issued in 1916, exhibiting mortality conditions in certain areas for the years 1890 and 1901 and during the decennium 1901-1910. These tables, which provide valuable comparative data for use in studying changes in mortality rates, will be included in a new edition of the life tables, materially enhancing their value. In connection with certain of the original tables there will be given commutation columns, annuities, and premiums at various rates of interest; and the data on which the

various tables were based, the derivation of the theory, and an explanation of the methods of computing them will also be shown.

Special Investigation of Influenza Epidemic.

A compilation of data in regard to the mortality resulting from the epidemic of influenza and pneumonia during the last four months of 1918 was made for the States of Indiana and Kansas and the city of Philadelphia. The results, in the form of tables and graphs, are now ready for publication.

Thanks are due to the United States Public Health Service for its generous financial assistance in this work.

International Statistical Year Book.

At the request of the secretary of the International Statistical Institute at The Hague, the Bureau of the Census compiled detailed data relating to the United States as a whole and to the States individually for inclusion in the International Statistical Year Book (*Annuaire Internationale de Statistique*). The work was begun in February, 1919, and completed in the following June.

Statistical Directory of State Institutions.

During the fiscal year 1918 the bureau brought to substantial completion the compilation of a statistical directory of State institutions for the dependent, defective, and delinquent classes; but because of the great amount of war work and other current work, the publication of this directory has been delayed. It is now in the hands of the printer, however, and will be issued at an early date.

Searching of Census Records to Determine Ages.

During the fiscal year 2,315 searches of census records were made for the Pension Bureau, in order to determine the ages of applicants for pensions and increases of pensions. Other searches were made for genealogical purposes and for the purpose of supplying statements as to the ages of children affected by the child-labor laws. A vast amount of work was done in searching the records to establish the ages of men who had not registered for military service, but were believed to be within the prescribed ages.

Miscellaneous Information Supplied Other Governmental Agencies and Outside Organizations.

Numerous compilations of statistical information from the bureau's records were made in compliance with requests received from other Federal bureaus and from private concerns, consisting

chiefly of industrial statistics. Among the organizations for which they were made were the Chamber of Commerce of the United States; the U. S. Tariff Commission; the Office of the Surgeon General, War Department; the General Electric Co.; Power Plant Engineering (periodical); the Sinclair Refining Co., Chicago; the Southwestern Electrical & Gas Association, Dallas, Tex.; and the National Association of Cotton Manufacturers.

WAR WORK.

Census of Materials and Commodities for Use of War Agencies.

This work, which was authorized on April 8, 1918, was described on pages 92 and 93 of my report for 1918. It was undertaken to secure statistical information needed by the War Trade Board, the War Industries Board, the Shipping Board, the Food Administration, the Council of National Defense, and the Commercial Economy Board, in regard to the production and stocks on hand of the following-named classes of commodities, listed in the order in which work upon them was begun: Kapok fiber; jute; leather stocks; boots, shoes, and manufactured leather goods; silk; antimony; graphite crucibles; wool manufactures—machinery and production; and iron and steel products. For each of these classes of commodities, except leather stocks, boots, shoes, and manufactured leather goods, and graphite crucibles, only one report was made, beginning with that for kapok fiber, which referred to May 1, 1918. For leather stocks, monthly reports relating to the last day of each month, May to December, 1918, and quarterly reports, as of March 31 and June 30, 1919, have been compiled; for stocks of boots, shoes, and manufactured leather goods, the reports referred to the last day of each month, June to December, 1918, and to March 31 and June 30, 1919; and for graphite crucibles, two reports were issued, as of June 30 and September 30, 1918.

The collection of statistics of leather stocks and stocks of boots, shoes, and manufactured leather goods is of great importance as a conservation measure. The collection of these statistics, at quarterly intervals, was accordingly continued at the request of the War Industries Board and upon the recommendation of the war service committee representing the shoe and leather industries of the United States Chamber of Commerce. A simplified form of schedule was used for the quarterly statistics.

Statistics for all the war commodities covered by the several inquiries have been revised and rearranged for printing in a con-

densed form more convenient for reference. This is designed to be the final presentation of these statistics, and will constitute a permanent record of the census of war commodities.

Census of Commercial Greenhouses.

This inquiry was made at the request of the priorities division of the War Industries Board, which desired the information for use in connection with fuel restrictions.

Work Done for Provost Marshal General.

The 293,788 enlistments in the Navy, the Naval Reserve, the National Naval Volunteers, and the Marine Corps during the period from April 2, 1917, to June 30, 1918, were allocated by the Census Bureau. Estimates were prepared in July, 1918, of the number of British subjects in the United States subject to draft under the terms of the conventions concluded between this country and Great Britain, and also of the numbers of men in the United States from 18 to 20 and from 32 to 45 years of age, inclusive.

Determination of Ages of Registrants.

District attorneys and other officials of the Department of Justice were, at their request, supplied with age certificates for men who, although of military age, had not registered for the selective draft; and men requesting it were given statements showing their ages as indicated by the census records.

Liberty Loan Work.

In connection with the Liberty Loans made during the fiscal year, the Bureau of the Census aided the Treasury Department by sending out literature to various mailing lists.

Compilation of Statistics Relative to Foreign Countries for Peace Conference.

This compilation comprised statistics of the movement of cereals, salt, oil, coal, and wood on the railways and waterways of Russia in 1908, 1909, and 1910, the latest years for which figures were available; a tabulation showing the distribution of manufacturing establishments and wage earners in Austria by industries and factory-inspection districts; and statistics in regard to the exports and imports of countries and colonial possessions in Africa.

Information for U. S. Shipping Board.

At the request of the U. S. Shipping Board, detailed tables were prepared showing the population and value of agricultural products within a radius of 100 miles of each of 28 cities located on the Atlantic, Pacific, and Gulf coasts.

Miscellaneous War Work.

In addition to the foregoing, the Census Bureau performed numerous small amounts of war work for the Post Office Department, the Navy Department, the Department of Labor, the Bureau of Foreign and Domestic Commerce, the Fuel Administration, the Federal Trade Commission, the Telephone and Telegraph Administration, the Office of the Chief of Engineers, the General Engineer Depot, the Office of the Director of Military Aeronautics, the Emergency Fleet Corporation, the Railroad Administration, the War Industries Board, the War Trade Board, the Capital Issues Committee, the Central Statistical Clearing House, the Employment Service, the Reconstruction Survey, the War Service Committee of the Rubber Industry of the United States, and the American Electric Railway Association War Board.

Members of Force Enlisted and Drafted Into Military and Naval Services.

During the fiscal year 25 office and field employees of the Census Bureau entered the military and naval services (not including those who joined as Army field clerks). The total number who entered those services from the outbreak of the war to the signing of the armistice was 79.

PREPARATIONS FOR THE FOURTEENTH CENSUS.

Fourteenth Census Law.

As set forth in my annual report for 1918, a bill to provide for the Fourteenth and subsequent decennial censuses was drafted by the Census Bureau and submitted to the House Committee on the Census. The bill was passed by the House of Representatives July 2, 1918, and by the Senate, with amendments, January 14, 1919; the conference report was adopted by the Senate February 28, 1919, and by the House March 3, 1919; and the bill was approved by you on March 3, 1919. In many respects it follows the lines of the Thirteenth Census legislation, but there are departures in regard to a few important features and numerous unimportant ones. The most significant points of difference are as follows:

Section 1.—Insertion of provision for census of forestry and forest products.

Section 6.—Reclassification of clerical salaries, so as to provide a much larger number of classes, differing from each other by only \$60 per annum between \$900 and \$1,440, and by \$120 per annum between \$1,440 and \$1,800; increase in compensation of clerical

and subclerical employees generally; and provision for preference to honorably discharged soldiers, sailors, and marines, and their widows, in making appointments to positions in all executive departments and independent governmental establishments.

Section 7.—Provision, applying to Federal service generally, requiring Civil Service Commission to examine applicants temporarily absent from the places of their legal residence without requiring them to return for the purpose of examination; and provision authorizing selection of temporary Census employees from reemployment registers established by Executive order of November 29, 1918.

Section 8.—Omission of provision for securing information in regard to unemployment on census date and during preceding calendar year and in regard to Civil War veterans; insertion of provision for obtaining information as to encumbrances on homes and farms; omission of provision for enumeration of inmates of institutions for dependent, defective, and delinquent classes (this inquiry to be made after close of census period); inclusion of inquiry as to sex of farm operators; amplification of irrigation inquiry; and addition of drainage inquiry.

Section 9.—Provision for appointment of supervisors by Secretary of Commerce, upon recommendation of Director of Census, instead of by President, by and with advice and consent of Senate.

Section 20.—Change of census date from April 15 to January 1; reduction of minimum size limit for cities in which enumeration must be completed within two weeks, from 5,000 to 2,500.

Sections 21-24.—These sections, which provide penalties for violations of the Fourteenth Census act, have been so drawn as to make them more effective and more readily enforceable than the corresponding sections of the Thirteenth Census act.

Section 31.—Provision for mid-decennial census of agriculture, to be taken in 1925 and at 10-year intervals thereafter.

Section 32.—Provision for biennial census of products of manufacturing industries, beginning in 1921.

Joint Advisory Committee of American Statistical and Economic Associations.

At my invitation, under date of November 18, 1918, the presidents of the American Statistical and American Economic Associations appointed a joint committee to advise the Director of the Census and the Department of Commerce in connection with the

work of the Fourteenth Census. This committee was composed of six members, namely:

Representing American Statistical Association—W. S. Rossiter, chairman, formerly chief clerk, Bureau of the Census, now president Rumford Press, Concord, N. H.; Prof. Carroll W. Doten, Massachusetts Institute of Technology; Dean Edwin F. Gay, Harvard University.

Representing American Economic Association—Prof. Wesley C. Mitchell, Columbia University; Prof. E. R. A. Seligman, Columbia University; Prof. Walter F. Willcox, Cornell University.

The joint advisory committee has thus far held six meetings. It has given very careful consideration to all phases of the census work thus far planned, and has made a number of helpful recommendations. The members of this committee have rendered valuable assistance in connection with the preparatory work of the Fourteenth Census.

Field Force.

Continental United States (exclusive of Alaska) was divided into 372 supervisors' districts. These districts, outside the large cities, were as a rule coextensive with the congressional districts; and each of the large cities was placed under the charge of a single supervisor, with the exception of New York City, which was divided into four districts.

At the Thirteenth Census the enumeration was made as of April 15, and at earlier censuses as of June 1, but under the existing law the next and subsequent censuses will be taken as of January 1. This necessitates the appointment of the supervisors at an earlier date than heretofore, and with the least possible delay.

Under date of March 17, 1919, the bureau issued a press notice announcing the date of the coming census, the approximate number of supervisors to be appointed, and the method of their appointment, and quoting the above instructions. Approximately 5,500 persons were supplied, upon request, with application blanks for the position of supervisor, similar to the forms used by the Civil Service Commission for "nonassembled" examinations; and about 2,200 of these applications were filled out and returned to the bureau. A suitable scheme of rating was devised, the papers were graded, selections were made, and a list of candidates recommended to me for appointment; and during August the appointments were made and announced through the public press.

The enumerators will be selected by the supervisors, with the approval of the Director of the Census. Each candidate will be required to undergo a practical test.

Office Force.

It is estimated that the total office force of the Fourteenth Census will reach at its maximum about 4,000, as against 3,738 at the last census. The estimated increase is proportionally smaller than the increase in the work to be done, but it is expected that certain changes in organization, improvements in methods, and developments in tabulating machinery will make possible some increase in the average amount accomplished per employee.

Of the 4,000 officials and employees who will compose the census force when at its maximum, between 3,000 and 3,500 will be temporary clerks. Most of these clerks will be appointed as the result of special examinations to be conducted by the Civil Service Commission this fall throughout the United States; and the remainder will be secured (1) by selection from the reemployment registers of the Civil Service Commission established under authority of the Executive order of November 29, 1918, as amended April 30, 1919; (2) by selection from the registers maintained by the commission for the departmental service generally; and (3) by transfer, reinstatement, etc., under the civil-service rules.

The office force on August 31, 1919, comprised 23 officials, 717 clerical employees, 39 subclerical employees, 30 mechanical-laboratory employees, and 42 special agents for general field work, etc., a total of 851. In addition, there were employed throughout the cotton belt 694 local special agents to collect statistics of cotton and cotton seed. These agents perform their work only at intervals and are paid on a piece-price basis.

Preparation of Schedules, Etc.

The various schedules, instructions, and other forms to be used at the coming census have been prepared, and most of the population and agricultural schedules have been distributed to the supervisors. In connection with the preparation of the agricultural schedule, the division of agriculture held numerous conferences with representatives of the various governmental departments interested in agricultural statistics, as well as with professors in agricultural colleges, and representatives of agricultural periodicals and of farmers' associations. As a result, a general farm schedule was formulated which has been very widely indorsed

and has received the unqualified approval of the joint advisory committee of the American Statistical and Economic Associations.

Encumbrances on Homes and Farms.

Section 8 of the Fourteenth Census act contains a provision, inserted by the Senate, for ascertaining the amount of encumbrances on mortgaged homes occupied by their owners, of which in 1920 there may be approximately 4,000,000. In order to obtain a part of the information required—that relating to the market value of the home, the amount of encumbrance, and the annual rate of interest—it will be necessary to use a special schedule. It is estimated that the additional cost of collecting and compiling this information will be at least \$1,000,000.

Outlying Possessions.

The Fourteenth Census act provides for censuses of Alaska, Hawaii, and Porto Rico, to be taken by the Bureau of the Census, and also for censuses of Guam, Samoa, and the Panama Canal Zone, to be taken by the respective governors of those possessions in accordance with plans prescribed or approved by the Director of the Census. In taking the census of Alaska the Bureau of the Census will cooperate with the Bureau of Education. The work will be done under the direction of William T. Lopp, in charge of the Alaskan division of the Bureau of Education. Arrangements are being made, through the War and Navy Departments and the Panama Canal officials, with the Governors of Porto Rico, Guam, Samoa, and the Canal Zone, for taking the censuses of those possessions.

Mechanical Equipment.

Work in mechanical laboratory.—The object of the mechanical laboratory, to have produced or to have on hand at the close of the fiscal year 1919 all parts entering into the construction of certain tabulating machinery for the work of the Fourteenth Census, has been practically attained.

Five automatic tabulating machines have been completed and tested, of which four are in actual use; and the remainder of the equipment of tabulating and sorting machines will be completed on or before February 1, 1920.

The original estimates pertaining to the card sorting machines took into consideration merely the work of overhauling. It was later found expedient to introduce some radical changes in design and method of operation, and the result has been the production of a practically new and much more efficient machine.

Integrating counter.—In my last two reports I have referred to the progress of the development of an “integrating counter”—that is, a counter which will record and add numbers instead of mere units, thus performing automatically the work done by the operator of an adding machine—for use in tabulating certain classes of census data. The numbers will be indicated on cards by punch marks, the cards will be fed into the machine, and the numbers will be automatically totalized. Several sets of figures can be totalized at the same time. The principal advantage to be derived from the use of the integrating counter lies in the facility with which the data may be regrouped or rearranged.

Work on the integrating counter, which began on July 6, 1917, is still in progress. The first model has been completed as an experimental machine, and it has added and recorded numbers as indicated on punched cards at the rate of from 20,000 to 25,000 cards a day. A complete set of drawings and all patterns necessary for manufacturing this type of machine have been made.

A tentative card system for tabulating part of the manufactures census has been developed and will be tested.

BUREAU OF FISHERIES.

(Dr. HUGH M. SMITH, *Commissioner*.)

General Considerations.

While the work of the Bureau of Fisheries has been resumed along normal lines, following several years of special adaptation to war requirements, changed economic conditions resulting from war demand, and are receiving, serious attention.

It is quite apparent that, owing to food shortage and the active campaigns that have been waged for the purpose of offsetting that shortage, the use of aquatic products has acquired a more prominent place. That place can be enlarged and firmly established with marked benefit to the entire country. The bureau seeks to render this service. It is incumbent on Congress to authorize and support the effort.

All the vessels placed at the disposal of the Navy during the war have been returned, and the use that the Navy was making of the marine biological stations at Woods Hole, Mass., and Beaufort, N. C., has been relinquished.

The discrimination against this service in the matter of the attendance of technical employees of the bureau at meetings of societies should be removed.

The bureau deserves liberal, whole-hearted, unsuspecting treatment at the hands of Congress. It is rendering a large public service in a modest, loyal, effective manner. It more than pays its own cost in each of several ways. The direct revenue accruing to the Government through the operation and administration of laws affecting the fisheries of Alaska exceeds all the appropriations for the support of the bureau. The actual revenue returns for the operations of the calendar year 1918 will be found to exceed \$2,865,000, a sum which includes the tax levied on preserved salmon, fish oil, and fish fertilizer; the net sales of fur-seal skins taken on the Pribilof Islands; the net value of fox skins from the same locality; the returns from other Alaskan products and enterprises coming within the purview of the Department; and fines resulting from convictions for violations of law (the amount involved in this last item being small).

Of even more importance is the indirect and immeasurable value of the food fish produced and planted and the food fish rescued and restored to the waters. Any attempt to represent by dollars the value of the fish-cultural work would be futile; but it may be noted that if the hatcheries had been commercialized their output in the fiscal year 1919, together with the fishes salvaged from the overflowed lands of the Mississippi Valley, would have had a market value of not less than \$2,000,000.

No cognizance need be taken, in this connection, of the commercial value to individuals and industries of the biological and technical inquiries conducted by the bureau, although this is great.

Planting the Waters.

The comprehensive and varied operations of the Bureau of Fisheries in artificially propagating food fishes and planting them in suitable waters have reached a high degree of effectiveness. This work has had a gradual development in response to the urgent needs of the country, and meets with hearty public support because of the obvious benefits. There is demand for an extension of operations into sections not adequately covered by existing hatcheries, more particularly for the purpose of maintaining and increasing the supplies of common species like the catfishes and buffalofishes that can be produced in large quantities and are wholesome food.

The output of the fish-cultural stations during the fiscal year 1919 aggregated over 5,875,000,000 fish and fish eggs, most of

the latter being consigned to State hatcheries. The distribution was more extensive than ever before, exceeding the best previous record of 1917 by more than 715,000,000 and surpassing the year 1918 by 1,779,000,000.

Humpback Salmon in Maine.

In March, 1917, over 900,000 humpback salmon were planted in Maine waters, that had become unsuitable for the Atlantic salmon. This year the results of this introduction of a Pacific species are becoming apparent. It is reported that the fish have been seen in thousands in the Dennys and Pembroke Rivers, and the herring weirs in Passamaquoddy Bay have taken considerable numbers. The success of this experiment, for which there is every reason for the bureau to be gratified, is confirmed by the taking of nearly 400,000 eggs from humpbacks in the rivers named, which will be incubated at the hatchery at Craig Brook, Me.

Rescue of Stranded Food Fishes.

Too much stress can not be placed on the importance of the work of rescuing food fishes from the overflowed lands in the basin of the Mississippi River and its tributaries. All of the fish left behind when the freshet waters subside inevitably succumb to the drying or freezing of the pools or ponds in which they congregate unless rescue parties seine out the cut-off waters and restore the fishes to the main streams.

The aggregate number of salvaged fishes in the summer and autumn of 1918 was upward of 55,800,000, comprising practically every species of food fish of the Mississippi Valley. About 600,000 of the rescued fishes were distributed by the bureau's cars to outside waters; the remainder were deposited locally in the main river channels.

These operations for the season of 1919 have been resumed on a larger scale. Although the work is still in progress, there is already a substantial increase over 1918, and the fall season may close with a record of 125,000,000 rescued food fishes. A summary to the end of September is here given:

Headquarters.	Fish salvaged.	Headquarters.	Fish salvaged.
Friar Point, Miss.....	680,583	Meredosia, Ill.....	2,349,404
Canton and Clarksville, Mo.....	1,033,391	La Crosse, Wis.....	23,229,430
North McGregor, Iowa.....	15,233,267	Homer, Minn.....	28,800,510
Bellevue, Iowa.....	24,882,420		
Cairo, Ill.....	4,830,820	Total.....	101,039,825

The extent of this work may be better realized when it is stated that a score of hatcheries would be unable to produce fishes in number and size equal to those rescued. Nothing affecting the welfare of the fisheries of the Mississippi basin is of greater importance than the prevention of the losses that occur under natural conditions.

Loss of a Pacific Salmon Hatchery.

Among other items in the deficiency bill as reported to the House of Representatives September 11, 1919, is one providing \$50,000 for the reconstruction of the fish hatchery and other buildings at Baker Lake, Wash., which, with the exception of the bunk house and barn, were completely destroyed by fire on July 24, 1919. The disaster occurred at a most unfortunate time, as the season was but half over and the prospects for a large output were the brightest in years. Immediate steps were taken to prevent the failure of the work in progress, and as soon as the appropriation becomes available the reestablishment of the station in accordance with the most modern practice will be pushed to the utmost.

Relations with the States in Fish-Cultural Work.

The fish-cultural operations of the bureau bring it into close relation with the various States, some of which are engaged in similar work, while others depend wholly on the Federal Government for the stocking of their waters with food fishes. In several States field stations are jointly operated by bureau and State employees, the eggs being incubated at the hatcheries most conveniently located or from which the resulting fish can be most advantageously distributed.

During the fiscal year 1919, upward of 670,000,000 eggs of freshwater and anadromous fishes were donated to 24 States for hatching and distribution under their own auspices.

The shad hatchery at the mouth of the Susquehanna River, Md., has remained closed because of the continued failure of the State legislature to take action in harmony with the stipulations of Congress. The equipment of this station has been distributed among various other hatcheries.

Biological Investigation of Fishes.

Many of the vital problems connected with fisheries and aquiculture require for their elucidation the application of scientific methods of investigation, and questions are constantly arising which require the services of trained biologists. The branch of

the bureau that gives particular attention to these matters has during the past year conducted a number of investigations addressed to definite needs.

Among the fishes that have been the subject of special inquiry is the paddlefish of the Mississippi Valley, one of the important food fishes of our interior waters, now in danger of commercial extinction because of the intensity of the fishery conducted chiefly for its eggs, which are made into caviar. Up to the present time no efforts to hatch the paddlefish artificially have been successful, and there has also been lack of definite information regarding the natural spawning of the fish. In cooperation with the department of conservation of the State of Louisiana, there was undertaken during the past year a special study of the breeding habits of the paddlefish, and groundwork has been laid for further inquiry which it is hoped may save this valuable fish.

There have been instituted various investigations of the Pacific salmons. A special inquiry was directed to the very extensive practice of taking immature salmon by trolling and seining off the coasts of California, Oregon, and Washington. The conclusion was reached that any method of fishing which destroys immature salmon is so destructive and wasteful that it should be discontinued. The Department has communicated the results of the inquiry to the interested States and has indicated its readiness to assist them in determining the best means of meeting this menace to the salmon industry.

Shellfish Investigations.

Important scientific investigations have been devoted to oysters, mussels, and other shellfish. A study of great practical significance has been conducted in Long Island Sound, the scene of very extensive oyster-cultural operations, that have become seriously impaired by failure of the spat to set. In some sections more than half the grounds have ceased to be cultivated because of the small yield of oysters thereon, and for the past two years the set of spat has been entirely negligible. A temporary field laboratory has been maintained at Milford, Conn., and inquiries indicate that the wholesale death of spat in the shore waters may be attributable to pollution in the form of sewage and trade wastes. It has therefore been found desirable, in cooperation with the water laboratory of the Bureau of Chemistry, to make special studies of the nature and effects of the various pollutants.

Further investigations pertaining to the propagation, feeding,

and growth of oysters have been conducted in Great South Bay, Long Island; Narragansett Bay, R. I.; Barnegat Bay, N. J.; all in cooperation with the State authorities. In extensive oyster beds in the York River, Va., a serious affection has for several years rendered the oysters unmarketable. The malady consists of a green discoloration associated with a watery and lean condition of the meat. No cause or remedy has yet been found, but the investigation is still in progress and will be continued until definite conclusions are possible.

The sea mussel continues to be one of the great unutilized aquatic resources of the north Atlantic coast. While the food value of this mollusk is well recognized, there has been curious delay in its general adoption into the dietary, even in the regions where it abounds and is best known. In continuance of its task of popularizing this valuable food article, the bureau has conducted a survey of the mussel beds of Maine, southern New England, and Long Island Sound, with a view to demonstrating the availability and abundance of mussels for use in a fresh condition and for preserving.

Between Portland and Eastport, Me., in six sections where the most important grounds are located, the survey showed upward of 1,200 acres of natural mussel beds, estimated to contain over 1,275,000 bushels. The best beds yield from 2,500 to 5,000 bushels to the acre. Leading packing houses on the north Atlantic coast are giving special attention to the canning of mussels, and there is reason to believe that the development of the mussel industry will not be long delayed and will add materially to the wealth and food supply of the country.

The practical operations in the artificial propagation of fresh-water pearly mussels, conducted at various points in the Mississippi Basin, resulted in the inoculation of 137,000,000 glochidia on suitable fish hosts. The output was less than in the previous year, owing chiefly to disturbed labor conditions. Investigations and experiments in the field of fresh-water mussels have continued to yield valuable results bearing on artificial propagation.

Among the crustacean shellfishes, the spiny lobsters of California and of Florida have been the subjects of studies addressed to their habits and growth. Upon the basis of the information furnished by the bureau to the State authorities of Florida, more effective protection has been provided by the legislature. Comprehensive reports on the life history of the blue crab and on the blue-crab fishery have been issued and are expected to be useful

to State officials concerned with the protection of the crab and the maintenance of the fishery. It may be noted with gratification that an increased catch of blue crabs in Chesapeake Bay has recently been had; and it is conceded that this has been due to the adoption of wise measures of conservation based on the bureau's investigations and recommendations.

Use of Fishes in Controlling Mosquitoes.

A novel and highly important extension of the scientific activities of the bureau has been the eradication of mosquitoes and the prevention of malaria in the vicinity of Army cantonments in cooperation with the Public Health Service. The duty devolving on the bureau in this cooperative work was the propagation of mosquito-eating fishes, their distribution in waters infested with mosquito larvæ, and the maintenance, in bodies of water that could not be drained, of conditions that promoted the effectiveness of small fishes in the control of mosquitoes. The most extensive operations were conducted in the vicinity of Camp Hancock and the city of Augusta, Ga., and the success there attained was so marked as to constitute a distinct advance in antimalarial work. The Surgeon General of the Public Health Service has expressed his appreciation of the assistance rendered, and has authorized the publication of a report setting forth the methods followed and the results achieved by the bureau in the extra-cantonment zone at Camp Hancock.

Increased Utilization of Aquatic Products.

The Bureau of Fisheries has continued to render a large and important service to the fishing industry, the fish trade, and the public generally through its efforts to popularize neglected fishes and find uses and markets for wasted water resources. The work has consisted of practical demonstrations, technical investigations and appropriate publicity, and has been made possible chiefly by the allotment by the President of funds placed at his disposal for the national security and defense. Undertaken primarily during the war to increase the supplies of food and permit the exportation of meats to Europe, this campaign has, of course, equal value as a means of reducing living costs and of giving aquatic foods a larger permanent place in the national dietary.

Appeal has been made to Congress for adequate funds for carrying on this work, and meanwhile it has been necessary to greatly curtail all activities and to abandon some that were rendering important benefits to large numbers of people. Attention is asked to Appendix B, relating to this subject.

New Sources of Aquatic Leather.

Material progress has been made in finding and utilizing new sources of leather from the skins of aquatic animals. The feasibility of producing commercial leather from such animals has been amply demonstrated, and the actual business has passed beyond the experimental stage, although work remains to be done in perfecting methods and in making generally known to the manufacturers of leather goods the availability and merits of the new products.

Many samples of aquatic leathers and of various articles made therefrom have been submitted to the bureau by private firms and have been favorably criticized by disinterested persons. Among the manufactured objects made from fishskins that have come to the attention of the Department are traveling bags, brief cases, pocketbooks, belts, shoes, and ladies' hand bags. It is reported that the demand for shark leather for traveling bags is now greater than the supply, and plans on a very extensive scale are being executed for increasing and maintaining the output of shark hides by the establishment of special shark fisheries on the Atlantic, Pacific, and Gulf coasts. Excellent leather for shoes is also being derived from sharks.

The duty imposed on the Department by Congress in June, 1917, when there was made available the sum of \$10,000 "for developing by the Bureau of Fisheries, in cooperation with the Bureau of Standards, new aquatic sources of supply of leather" may be regarded as having been accomplished, and private enterprise will now undoubtedly do what may be necessary to develop and give permanency to the industry.

Alaska Fisheries Service.

The usual duties involved in the administration of the Alaskan fisheries have been performed. The corps of agents and wardens was supplemented by a stream-watchman patrol inaugurated in the season of 1918, consisting of 10 men engaged for the active fishing season. In addition to the enforcement of the laws and regulations governing fishing, the inspection of private salmon hatcheries and the taking of the census of red salmon entering Wood River, special investigations of a scientific and practical nature were made; work was done in opening up salmon streams for spawning; public hearings were held at Seattle concerning commercial fishery operations and conditions in the Copper and Yukon Rivers and all streams of southeastern Alaska; and detailed statistics of the fishery industry were compiled.

The returns for 1918 show a larger production than that of 1917, which far exceeded previous records. The number of persons employed in all branches of the industry was 31,213, an increase of 1,722 over 1917; the capital invested was \$73,750,789, an increase of \$18,813,240; and the value of products marketed was \$59,154,859, an increase of \$7,677,879. The increased value of products was chiefly owing to the larger pack of canned salmon in 1918 resulting from the strenuous effort to meet the food shortage. The canned-salmon industry surpassed all records, the pack reaching the grand total of 6,605,835 cases of forty-eight 1-pound cans, valued at \$51,041,949. Of this, approximately three-eighths of the quantity and nearly one-half of the value represented red salmon. The salmon sold in a fresh, frozen, salted, and smoked condition brought the total value of the salmon to \$53,514,812. Thus 50 years after the acquisition of Alaska, the salmon output alone was worth seven and one-half times the purchase price.

The Alaska fisheries service merits liberal appropriations from Congress. The corps available for enforcing the laws and regulations and for carrying out other obligations arising out of administrative responsibility is still inadequate. The vast extent of the salmon industry and the heavy drains that are being made on the supply necessitate an enlarged personnel for maintaining and extending the patrol, for making special investigations, and for conducting various lines of constructive work in the interest of the industry. Several large hatcheries should be established in regions of most extensive fisheries, such as Karluk and Nushagak.

The following is a summary of results of efforts of the Bureau of Fisheries to introduce the Scotch method of curing herring in Alaska during 1917 and 1918. The figures for 1919 are not yet available.

Total cost of work, about.....	\$12,000
Pack, as follows:	
1917, 7,622 barrels (1,905,000 pounds).....	114,330
1918, 38,977 barrels (9,744,250 pounds).....	748,606
Total value.....	862,936

Alaska Fur-Seal Service.

The calendar year 1918 was the first after the expiration of the law imposing a close time on the commercial killing of seals on the Pribilof Islands. The quota of skins that might be secured was fixed at 35,000 and the number actually taken was 34,883, all but 1,002 of which were procured by August 10, when operations have usually ceased because of the beginning of the stagy season.

For the season 1919 the quota was tentatively fixed at 35,000, and the number of skins actually secured to August 10 was 25,381. The conditions of the herd warranted the taking of a considerably larger number of skins, but the scarcity of experienced men, combined with the increased labor involved in removing and handling the skins of the larger seals, to which special attention was given, reduced the season's output. The epidemic of influenza which ravaged Alaska necessitated the establishment of a quarantine to protect the susceptible natives of the seal islands, and it became impossible to carry out the plans for obtaining additional labor.

In an effort to improve transportation facilities on the seal islands three tractors and a number of wagons for trailers have been sent this year. This equipment will not only be of the greatest value in transporting sealskins from the killing grounds to the salt houses, but will furnish the means of hauling carcasses from the killing grounds to the newly established by-products plant. The tractors will also be very useful in constructing roads.

With a special appropriation made by Congress, there has been purchased a power lighter for use at the Pribilof Islands and between the islands and Unalaska, the nearest commercial port, 250 miles distant. This vessel will be equipped with wireless apparatus, and a rapid-fire gun for use in any emergency that involves the protection of the seal herd.

Most of the supplies required for the Pribilof Islands and the products derived therefrom were transported on the steamer *Roosevelt*, which made three voyages between Seattle and the islands during the year. On the final voyage the vessel did not leave the islands until December 12, which appears to be the latest recorded date for any vessel in that part of Bering Sea. Certain supplies and products were carried by the Coast Guard cutter *Bear* and the naval radio tender *Saturn*. The lighthouse tender *Cedar* of this Department transported heavy pieces of machinery for the by-products plant.

The very trying service required of the steamer *Roosevelt* during the years actively engaged in the Alaska work, combined with the heavy duty that the vessel had performed in her memorable Arctic career, developed defects the repair of which would have necessitated a large outlay out of proportion to her total value. She was, therefore, sold at public auction in Seattle on July 15, 1919, for the sum of \$28,000.

A very comprehensive account of the fur-seal service in 1918 is contained in a special report on Alaska fisheries and fur industries published by the Bureau of Fisheries. The native wards of the Government and their physical, mental, and financial condition are discussed at length.

There is need for an enlarged administrative personnel on the Pribilof Islands, including a superintendent and a biologist. With the acquisition of a vessel for interisland service, the islands need not hereafter be managed as distinct entities, but should be affiliated under one coordinating head. Vital scientific and technical problems are involved in the management of the rapidly increasing seal herd, and the creation of the position of biologist is demanded.

Alaskan Seal Herd.

The fur seals resorting to the Pribilof Islands are continuing to increase under the beneficent protection afforded by the international agreement prohibiting pelagic sealing. The only untoward feature has been the accumulation of older male seals far beyond the requirements for breeding purposes during the 5-year close time. Fortunately, the bureau has found a means of utilizing to the pecuniary advantage of the Government the skins of surplus bulls, and the gradual elimination of disproportionate elements is proceeding.

The seal census of 1918 gave 496,611 animals of all ages as composing the herd on August 10, after the close of the regular killing season. The corresponding census for 1919, the results of which have been communicated by telegraph and are subject to slight revision, showed 524,260 seals in the herd as of August 10, in addition to the 26,383 seals that had been taken for their skins subsequent to the previous enumeration. The numerical strength of the herd increased about 11 per cent from 1918 to 1919. The detailed figures for 1919 are as follows: Breeding females, 157,172; new-born pups, 157,172; yearlings of both sexes, 92,891; 2-year-olds of both sexes, 66,352; males 3 years old, 13,576; males 4, 5, and 6 years old, 20,080; harem bulls, 5,158; idle and surplus bulls, 11,859; average harem, 30.47.

Marketing Products of the Seal Islands.

During the fiscal year ended June 30, 1919, there were two sales of sealskins held October 7, 1918, and April 28, 1919. Fox skins were also sold at the October 7, 1918, sale.

The sealskins numbered 12,002, and were dressed, dyed, and machined before being offered for sale at public auction in St. Louis, Mo. The gross proceeds were \$777,931; the expenses, including cost of preparation of skins, transportation, agents' commission, discount for cash, etc., aggregated \$233,195.52; the net proceeds were thus \$544,735.78.

The fox skins sold at public auction in St. Louis numbered 692 blue and 19 white pelts. The gross receipts were \$58,179.50, the expenses were \$6,280.86, and the net proceeds were \$51,898.54.

On September 10, 1919, there were sold at St. Louis by Messrs. Funsten Bros. & Co., agents of the Department of Commerce, 9,055 dressed, dyed, and machined fur-seal skins and 665 blue and 30 white-fox skins. The total gross price realized was approximately \$960,000. The sealskins averaged \$91.35, an advance of 30 per cent over the prices realized last April. The blue foxes averaged \$195.90, an advance of 135 per cent over prices realized last October, when the last sale of Government blue foxes occurred. The market was strong, bidding was spirited throughout, and there was a very large attendance of buyers. The results of this sale are highly gratifying.

A noteworthy development of the fur-seal industry during the year has been the demonstration of the high value of the skins of old male seals usually designated as "wigs" and the creation of an active demand for such skins. At the public auction sale in October, 1918, the best prices received for any sealskins were for "wigs," an experimental lot of which brought \$75 each. At the sale in April, 1919, a considerable number of "wigs" were offered for sale in a dressed and dyed condition; these sold for \$77 to \$88 each, while the average price for all skins was \$66. It should be noted that formerly "wigs" in the raw state were regarded as having little or no value in the London market.

The seal-island natives continue to collect old seal bones at times when they have no other work. They are encouraged to do this, and are paid for their labor. In 1919 about 300,000 pounds of bones were gathered, sacked, delivered on board Government vessels, and landed in Seattle and San Francisco. The net proceeds amounted to \$3,891.03.

It is estimated that, when the entire take of sealskins for the calendar year 1918 shall have been dressed, dyed, machined, and sold, the net revenue to the Government, based upon the proceeds obtained at the sale of September 10, 1919, will be in excess of \$2,450,000. To this should be added an approximate

net revenue of \$123,000 for the sale of fox skins. It is safe to say that, when the proceeds of the sales of bones, oil, and other by-products are taken into account, the net revenue for the products of the calendar year 1918 will reach a sum in excess of \$2,600,000. This would more than pay all expenses of every nature connected with the administration of the Pribilof Islands, the Alaskan salmon fisheries, and the care of the minor fur-bearing animals of Alaska for a period of 12 years.

The accumulated experience of the Department under the contract with Funsten Bros. & Co., of St. Louis, Mo., for dressing, dyeing, machining, and selling fur-seal skins and for selling fox skins from the Pribilof Islands has proved very beneficial to the Government. The contractors have rendered highly satisfactory service in every feature. They have not only scrupulously observed every expressed and implied obligation of their contract, but they have willingly assumed other responsibilities and duties which, while meaning nothing to them in a pecuniary way, have meant much to the Government. The service rendered has been of a high order; the quality of the finished products has been superior to the best obtainable elsewhere; the methods of conducting the public auction sales have deserved and received the approbation of the entire fur trade; and the financial interests of the Government have been constantly safeguarded. The Government-owned furs have been in active demand and have brought the highest prices in the history of the fur business.

As a result of the profit to the Government under the contract the latter has been extended so as to expire on December 15, 1926.

Minor Fur-Bearing Animals of Alaska.

The minor fur-bearing animals of Alaska have received the usual attention, with assistance from special wardens whose services have been available through a reciprocal arrangement with the Governor of Alaska. There have been a number of prosecutions for violations of the regulations, and seizures of furs have been made from time to time. The furs thus confiscated have been sold at public auction and the proceeds covered into the Treasury of the United States.

There have been two modifications of the regulations: The use of dogs for pursuing and killing fur-bearing animals for which close seasons exist has been prohibited, and the open season on foxes in the region drained by streams flowing into the Arctic Ocean north of the sixty-eighth parallel of north latitude has been

extended 30 days, or until April 15. Fur-farming operations have been continued at a number of places along the coast and in the Yukon region, and some successful results have been reported.

Through the cooperation of postmasters, collectors of customs, shippers, and others, the usual compilations of statistics of furs shipped from Alaska have been made possible. The value of furs for the year ending November 15, 1918, was \$1,363,330, as compared with \$1,064,249 for the previous year, due largely to the advance in the price of furs. With the exception of lynx, there was also an increase in the number of pelts of the more important species of fur-bearing animals shipped from Alaska. The more notable increases were of ermine, foxes, mink, muskrat, land otter, wolves, and wolverines.

Fishery Legislation Needed.

The most urgent requirement in connection with the fisheries of Alaska is for a new code covering the salmon fisheries to replace the existing obsolete and inadequate laws. Proper administration, efficient regulation, rational conservation, and fair revenue to the Government can not be secured unless the salmon laws are revised to meet present conditions. Legislation is desired also to lodge the administration of the minor fur-bearing animals of Alaska elsewhere than in the Bureau of Fisheries, an agency whose legitimate functions are entirely irrelevant to land mammals.

There is urgent need also for amendment of the law of June 14, 1906, prohibiting aliens from engaging in the fisheries of Alaska. The defects in the present law result in the violation of the spirit of the law and permit the actual exploitation of the fishery resources of Alaska by alien fishermen operating independently and having no regard for laws or regulations designed to perpetuate the industry.

The prevention of waste in the Alaskan halibut fishery and protection to the halibut grounds should be promptly brought about by legislation in accordance with the recommendation of the American-Canadian Fisheries Conference. Legislation to be effective should be uniform in the United States and Canada.

BUREAU OF LIGHTHOUSES.

(GEORGE R. PUTNAM, *Commissioner.*)

Cooperation with Navy and War Departments.

The lighthouse vessels and stations operated under the jurisdiction of the Navy Department during the war were returned to the Lighthouse Service July 1, 1919.

The Lighthouse Service, in addition to the work done by the tenders directly under the orders of the War and Navy Departments, during the war provided facilities at various depots for the berthing of naval vessels, and at the general lighthouse depot at Tompkinsville, N. Y., provided special coaling facilities and quarters for naval detachments. Additional buoys were placed, and other changes in aids to navigation were made, as required. Repairs to naval patrol boats were made at various points, and various buoys, moorings, and other appurtenances were transferred to or purchased for the Navy and War Departments. The Lighthouse Service also cooperated with the Navy Department and Treasury Department in connection with improvements in coast-communication facilities by telephone and radio and in the transmission of reports received from light stations and considered of possible military value.

Because the tenders of the Lighthouse Service are particularly well equipped for handling buoys, moorings, etc., and their officers are thoroughly familiar with the coast line and waters of the United States, these vessels were effectively used by the War Department in mine-planting operations and by the Navy Department in laying submarine-defense nets, etc., during the war and later in removing these defenses.

Aids to Navigation.

In addition to this cooperation with the military service, the regular work of the Service in maintaining and improving aids to navigation was actively carried on during the year. During the fiscal year three important light and fog-signal stations were established from special appropriations—namely, at Lorain Harbor, Ohio, at the end of the west breakwater, to mark the entrance to the harbor; at Sand Hills, Mich., to mark a dangerous locality on the south shore of Lake Superior; and at Lime Kiln, San Juan Island, Wash., to mark an important point on the route from Puget Sound to British Columbia and Alaska.

Three unwatched acetylene lights were established in the Caribbean Sea to mark the traffic lane between the Gulf coast of the United States and the Panama Canal through Yucatan Passage. This important maritime track lies between low coral reefs and islands in the northwestern part of the Caribbean Sea. The work was done in cooperation with the Navy Department, which furnished a gunboat to transport the working party and materials.

An unwatched acetylene light was established at Dog Island, Me.

During the year 36 new aids were established in Alaska, including 19 light stations, 1 gas and bell buoy, and 16 other aids. The total number of aids to navigation in Alaska at the end of the fiscal year was 475, being a net increase of 36 over that of the preceding fiscal year, and the total number of lights was 180. The appropriation by the sundry civil act approved July 19, 1919, of \$75,000 for aids to navigation in Alaska has permitted active steps toward further safeguarding those dangerous waters.

The work to be done was already listed, ready, when the money became available and instructions to proceed were given by telegraph in order to accomplish as much as possible during the present season.

A total of 736 new aids to navigation were established during the year, including 178 fixed lights, 6 float lights, 1 light vessel, 73 gas buoys, and 469 other aids, the total number in commission on June 30, 1919, being 16,075, a net increase of 400 over the preceding fiscal year.

Considerable work was done during the fiscal year in repairing damage to aids to navigation caused by ice floes during the winter of 1917-18, especially to screw-pile structures in Chesapeake Bay and Potomac River. Much was also done in repairing hurricane damage to aids in the Gulf of Mexico, reconstructing stations, so far as practicable, in a manner calculated to better withstand future destruction.

Various special works were actively in progress during the year, including the establishment of important new light and fog-signal stations and lighthouse depots, improvements in systems of fixed aids and buoyage, etc.

Improvement in illuminating and fog-signal apparatus of existing aids was continued. Fixed lights were replaced by flashing or occulting lights at 20 stations, including two light vessels; incandescent oil-vapor lights were substituted for oil-wick lamps at 4 stations; and acetylene or electric incandescent illuminant was substituted at 36 stations, including 5 light vessels and 2 buoys. The fog-signal apparatus at 7 important stations was improved by the substitution of air diaphones for less efficient apparatus.

General repairs required to maintain aids to navigation in efficient condition were continued, but insufficiency of funds prevented this work being done to the proper extent.

Damage to lighthouse property, estimated at \$13,500, was sustained on December 8, 1918, by a fire at Execution Rocks Light Station, N. Y. The fog-signal engine and machinery, also the tower, oil house, and dwelling, were damaged.

On March 11, 1919, a gas buoy burst while being tested at a lighthouse depot by means of hydrostatic pressure, injuring two employees, one of whom died later as a result of injuries received. The accident was carefully investigated and steps taken to insure the observance of precautions.

An earthquake and tidal wave of considerable intensity occurred in Porto Rico and vicinity on October 11, 1918. Lighthouse property was not seriously damaged, except at Point Borinquen and Point Jiguero Light Stations.

The mild winter of 1918-19 presented a great contrast to the severe weather of the preceding winter, and permitted the removal of buoys from their stations for the winter without loss or trouble, and in some cases buoys usually removed for the winter were kept on station throughout the year. This rarely happens in north Atlantic waters.

Vessels.

There is a very urgent need for the construction of additional vessels for the Lighthouse Service, to replace those worn out in service, those lost through various casualties, and to meet the considerable growth of the Service in recent years. A full statement of this situation is given in Appendix A to this report.

Relief Light Vessel No. 51, stationed on Cornfield Point light vessel station, Conn., was collided with and sunk by a barge in tow of a Standard Oil tug on April 24, 1919. The light ship went down in eight minutes after being struck. Good judgment and discipline on the light vessel were shown in the emergency. No injury was sustained by the crew. The lifeboat and log and fog-signal books were the only property of the light vessel saved. This vessel was of iron, built in 1892. The owner of the tow has been called upon to indemnify the Government.

Bush Bluff Light Vessel No. 97, was surveyed and condemned for sale, being in such a poor condition as not to warrant repairs. Bush Bluff Station is now marked by a gas and bell buoy, the bell being operated by carbonic-acid gas, a test installation of this apparatus.

The tender *Cedar* performed urgent special duty in connection with the influenza epidemic last fall. Physicians and nurses in

charge of a medical officer of the United States Public Health Service were carried to isolated localities in southeastern Alaska, principally native Indian villages.

Lighthouse Depots.

Construction of the lighthouse depot for the sixteenth district, at Ketchikan, Alaska, for which an appropriation of \$90,000 was made by act of July 1, 1918, was actively carried on during the year. On June 30, 1919, the wharf was about 95 per cent completed, and the entire work, including storehouse, shops, etc., about 35 per cent completed.

Important improvements are in progress at the general lighthouse depot, Tompkinsville, N. Y. The act of March 28, 1918, appropriated \$60,000 for repairs to the wharves. This work includes the removal of the old wooden wharf decks and construction of concrete decks with cast-iron pile columns and other improved features. In order to permit use of the wharves while improvements are in progress, the work is being done in three sections. The first section, the south wharf, was completed in February, 1919. It is expected that the second section will be completed about September, 1919.

In August, 1918, you allotted from your fund for national security and defense \$175,000 for improvement of coaling facilities at this depot, with particular reference to cooperation work with the Navy. This work is in progress, and it is expected will be completed about February, 1920.

The act of July 19, 1919, appropriated \$30,000 for extending and enlarging the machine shop at this depot, and plans are being prepared.

The act of June 12, 1917, appropriated \$21,000 for improving the office and laboratory at this depot. This work has been completed, except the installation of a heating system and other work of minor importance.

The act of July 1, 1918, appropriated \$85,000 for the construction of a depot for the second lighthouse district. A portion of the old marine-hospital property in Chelsea has been transferred as a site for this depot. The work is in progress, but the amount available is quite insufficient for the complete construction.

The act of June 20, 1918, authorized \$275,000 for improvements at the lighthouse depot at Portsmouth, Va., or establishing a new depot, but no appropriation has been made for this work. This is the principal depot of one of the largest lighthouse districts and is the headquarters for five tenders and two light vessels.

The facilities for berthing these vessels is entirely inadequate, and the efficient operation of the vessels is much hampered in consequence. The inadequacy of space for storing and handling buoys also causes delay and loss.

A new depot for the seventh lighthouse district, at Key West, Fla., is urgently needed for the efficient and economical handling of the work of the district. The present depot is located on property belonging to the Treasury Department, with naval coal sheds and piers on either side. The space allotted the Lighthouse Service for buoys and appendages is entirely inadequate. The depot consists of a wooden storehouse built on a wooden pier. There is no oil house at this depot, due to lack of space, and kerosene, gasoline, and other inflammable supplies have to be kept in the storehouse, constituting a constant menace of fire.

Suitable depot facilities at Honolulu for the nineteenth lighthouse district are also much needed, and an estimate has been submitted for this purpose.

Improvement of Apparatus and Equipment.

Radio equipment was installed on 28 light vessels and on 12 tenders during the fiscal year. At the end of the fiscal year 41 light vessels and 23 tenders had been equipped with radio installations.

The installation of telephones at light stations was continued during the year. This work was done by the United States Coast Guard under an appropriation to develop coastal communications, including connections with important light stations. On June 30, 1919, there were 139 light stations so connected.

Experiments and tests with various devices and equipment used in lighthouse work have resulted in developing improvements in the interests of efficiency and economy. Among these may be mentioned improvements in diaphone installations, resulting in simplicity of operation, reduced space required for machinery, and lowered initial cost. A new type of metal buoy was developed for use in defining shoal-water channels, being an improvement over wooden spar buoys, which are less conspicuous and more expensive to maintain. The stability of the type I, gas and bell buoy moored in the exposed waters of Alaska was improved.

On account of immunity from submarine boring insects the use of palmetto piles has been extended in southern waters.

An improved device for fastening moorings to buoys in the upper Mississippi River was tested and proved satisfactory.

Investigation of the use of radio for fog-signal purposes was interrupted by war activities, but is now resumed.

Personnel.

On June 30, 1919, there were 5,964 persons employed in the Lighthouse Service, including 125 technical, 156 clerical, and 5,683 employees connected with light stations, vessels, and depots. This Service is charged with the maintenance of aids to navigation along 47,300 statute miles of coast line and river channel.

The retirement system for the field service of the Lighthouse Service was put in effect upon the appropriation by Congress of the necessary funds by act approved November 4, 1918. By the same act the retirement law was amended to the extent that the provisions of the law do not apply to persons in the field service whose duties do not require substantially all their time. The effect of the retirement system has been very advantageous, both to the Service and the personnel, and at a moderate expense.

Saving of Life and Property.

During the fiscal year services in saving life and property were rendered and acts of heroism performed by employees of the Lighthouse Service on 111 occasions. Many of these acts were considered especially meritorious, and the employees were individually commended by me.

Administration.

The system of cost keeping for the Service was modified, reducing the amount of detail work required in district offices without sacrificing the essential data furnished. This modification was necessary in order that other important work might be kept up.

The Department approved regulations for the distribution of lighthouse publications on a sales basis, pursuant to act of Congress of June 20, 1918. This was put in effect January 1, 1919. Sales agencies have been established at the principal ports. Returns of sales are made to the Superintendent of Documents, Washington, D. C., who supplies the necessary copies of the publication.

The appropriations for the maintenance of the Lighthouse Service for the fiscal year 1920 are \$6,625,000, being \$474,570 in excess of those for the preceding fiscal year, and include \$45,000 for retired pay. In addition, there are special appropriations

aggregating \$794,400, including \$440,000 contained in the deficiency act of November 4, 1918.

The appropriations for the maintenance of the Lighthouse Service for the fiscal year 1920 were \$1,054,600 less than the estimates submitted, and additional funds will be necessary for even the minimum maintenance of the Service during this fiscal year.

During the last fiscal year \$774,000 was transferred from Navy Department appropriations to make good deficiencies in the maintenance of the Lighthouse Service, but as the vessels and stations were transferred back on July 1, 1919, funds will not be available from the similar provisions in the naval appropriation act this year.

Systematic inspections have been continued in the various lighthouse districts of the technical work, business methods, and property accounts.

Special Legislation Needed.

The act of August 29, 1916, authorizing the President to transfer to the Navy or War Department portions of the Lighthouse Service when there is a national emergency, should be amended so as to definitely define the status of the personnel transferred. All persons so transferred who serve on vessels or at stations where they are exposed to the risks of war, should have a suitable military status, and be entitled to all relief provided by legislation for those in the military services. Although the personnel transferred during this year were, under rulings of the Treasury Department, given the benefits of the war-risk insurance, there was considerable conflict in decisions as to their standing under the act of August 29, 1916. All of the personnel were in an indefinite and anomalous position in their relations with the military and naval personnel. Specific recommendation is deferred until conditions become more settled. In any future transfer of vessels there should, if practicable, be more definite understanding as to the extent to which tenders are to be diverted from their lighthouse duty. The upkeep of the system of aids to navigation requires every effort of the present equipment of tenders, and their efficient maintenance is even more important in time of war than in normal times.

Legislation is recommended to cover adjustment of claims by lighthouse employees for loss or damage to personal property,

such as clothing, furniture, etc., caused by storm, tidal waves, collisions, or fire at light stations, depots, and on vessels. Such provision should be made in justice to these employees engaged on hazardous duty. By act of June 17, 1910, it was provided that claims against the Government for damages not exceeding \$500 arising out of collisions for which lighthouse vessels are responsible be determined and settled by the Commissioner of Lighthouses. This provision has enabled the Government to adjust claims promptly and has relieved Congress of the annoyance of many petty claims; and similar legislation covering losses of personal property by lighthouse employees would be advantageous to the Government and result in more equal justice to employees.

Legislation is also recommended providing for medical relief for lighthouse keepers without charge at other than hospitals and stations of the Public Health Service. The hospitals and stations of the Public Health Service, at which free treatment is now provided for lighthouse keepers, are obviously inaccessible for a large number of keepers.

Legislation is recommended authorizing the establishment and maintenance of post-lantern lights and other aids to navigation on the Yukon River and its tributaries, Alaska. The waters of the Yukon delta are already being marked, but congressional authority is required for the Lighthouse Service to extend its jurisdiction to the nontidal waters of these rivers. Navigation of the Yukon River is increasing, and as it is navigable for a long distance many lights and day marks are required.

An appropriation of \$50,000 is strongly recommended for establishing and improving aids to navigation in the Virgin Islands of the United States, West Indies, and adjacent waters. This work was authorized by Congress by the act approved June 20, 1918 (40 Stat., 608), but no appropriation has been made. The Naval Governor of the Virgin Islands in a letter dated July 15, 1919, strongly urged that this matter be given the serious consideration it deserves in order to facilitate and safeguard the very large amount of shipping in these islands.

The act of June 20, 1918, providing for voluntary retirement at the age of 65 after 30 years' service, and compulsory retirement at the age of 70, for certain classes of employees of the Lighthouse Service has proved beneficial both to the men eligible to retirement and to the Service in replacing such men with

younger and more capable employees. Still greater efficiency, however, will result and hardship to deserving employees will be avoided if the same benefits are extended to persons who become disabled from efficiently performing their duties by reason of disability incident to their work, such disability being distinct from that caused by injury received in the line of duty, for which compensation is now provided by law. Legislation to this end is recommended.

Appropriations for Special Works.

The sundry civil act approved July 19, 1919, made the following appropriations for special works in the Lighthouse Service:

Restoring and improving Execution Rocks Light Station, N. Y.	\$10, 000
Rebuilding Point Jiguero Light Station, P. R.	24, 000
Improving the light and fog signal at Manitowoc Breakwater Light Station, Wis.	9, 000
Completing the removal and rebuilding of Chicago Harbor Light Station, Ill., and establishing lights on the new breakwater in Chicago Harbor.	6, 400
Constructing light keepers' dwellings and appurtenant structures, including sites therefor, within the limit of cost fixed by the act approved February 26, 1907.	50, 000
Extending and enlarging the machine shop at the lighthouse depot, Tompkinsville, Staten Island, N. Y.	30, 000
Providing riprap to reinforce foundations of light stations and constructing or improving boat landings in the third lighthouse district.	150, 000
Establishing new aids to navigation and improving existing aids in Alaska. .	75, 000

Measures were taken to inaugurate work on all these projects and to push them to completion as promptly as possible.

The deficiency appropriation act now pending contains the following items for the Lighthouse Service:

Constructing or purchasing and equipping tenders and light vessels to replace those worn out in service.	\$760, 000
Diamond Shoal Light Vessel, N. C.	450, 000
Completing the light and fog-signal station at Conneaut, Ohio.	19, 600

The item of \$760,000 is of special importance, marking the beginning, and only the beginning, of the process of replacement of the many old and worn-out vessels in the Service, referred to in Appendix A of this report. The item of \$450,000 for Diamond Shoal is for the replacement of the light vessel sunk by a German submarine on August 6, 1918.

COAST AND GEODETIC SURVEY.

(Col. E. LESTER JONES, *Superintendent.*)**Important Publications.**

Two publications of special importance were issued during the fiscal year 1918.

One of these is the series of publications on the Lambert Conformal Conic Projection. The principle of the Lambert projection is in a measure graphically illustrated in the figure opposite.

Many methods of projection have been designed to solve the difficult problem of representing a spherical surface on a plane. As different projections have unquestionably merits as well as equally serious defects, any region to be mapped should be made the subject of special study and that system of projection adopted which will give the best results for the area and purposes under consideration.

The Mercator projection, almost universally used for nautical charts, is responsible for many false impressions of the relative size of countries differing in latitude. The polyconic projection widely used and well adapted for most topographic and hydrographic surveys, when used for the whole of the United States in one map, has the serious defect of unduly exaggerating the areas on its eastern and western limits. Along the Pacific coast and in Maine the error in scale is as much as $6\frac{1}{2}$ per cent, while at New York it reaches $4\frac{1}{4}$ per cent.

The value of the new outline map on the new Lambert projection can best be realized when it is stated that throughout the larger and most important parts of the United States—that is, between latitudes $30\frac{1}{2}$ and 49° —the maximum scale error is only one-half of 1 per cent. This scale error of one-half of 1 per cent is frequently less than the distortion due to the method of printing and to changes from the humidity of the air. Only in southernmost Florida and Texas does this projection attain its maximum error of $2\frac{1}{3}$ per cent.

The Lambert projection is well adapted to large areas of predominating east-and-west dimensions, as the United States, where the distances across from east to west is one and four-fifths times that of the distance north and south.

The strength of the polyconic projection, on the other hand, is along its central meridian. The merits and defects of the two systems of projection may be stated in a general way as being at right angles with each other.

Special features of the Lambert projection that are not found in the polyconic may be stated briefly, as follows:

LAMBERT'S CONFORMAL CONIC PROJECTION

Diagram illustrating the intersection of a cone and sphere along the two standard parallels.

1. The Lambert projection is conformal; that is, all angles between intersecting lines or curves are preserved, and for any given point (or restricted locality) the ratio of the length of a linear element on the earth's surface to the length on the corresponding map element is constant for all azimuths or directions in which the element may be taken.
2. The meridians are straight lines and the parallels are concentric circles.

3. It has two axes of strength instead of one, the standard parallels of the map of the United States being latitudes 33° and 45° , and upon these parallels the scale is absolutely true. The scale for any other part of the map, or any parallel, can be obtained from tables contained in one of the series of these publications. By means of these tables, the very small scale errors in this projection can be entirely eliminated.

The other publication is the Report on the Connection of the Arcs of Primary Triangulation Along the Ninety-Eighth Meridian in the United States and in Mexico and on Triangulation in Southern Texas.

An event of the greatest importance in the history of geodesy was consummated in the spring of 1916, when observations were made at stations on the northern and southern banks of the Rio Grande, which connected the arcs of primary triangulation which had been established in the United States and in Mexico along the ninety-eighth meridian. The connection is interesting to the geodesist, because it makes available a very long meridional arc of connected and completed triangulation.

This connection will make available data from which to compute with greater accuracy than heretofore the dimensions of the earth. This will in itself make the work a notable contribution to science. But of even greater moment is the fact that the connection of the triangulation of the United States and Mexico will enable the latter country to extend to new areas from the ninety-eighth meridian arc geodetic control for surveys and maps in the form of triangulation which can be made on the North American datum.

This datum had been called the United States standard datum previous to the year 1913, when it was also adopted by Mexico and Canada for their geodetic coordinates. Its designation was changed to the North American datum when it had thus attained an international character.

Field Work.

This country was at war with Germany during the period this report covers, and the naval needs of the country required all available vessels. It was, therefore, very late in the fiscal year 1919 before any vessels could be released for civil duties. The five vessels of the Coast and Geodetic Survey that had been transferred to the Navy Department to meet its needs were retransferred to the Coast and Geodetic Survey April 1, 1919, by Executive

order. These vessels are the *Surveyor*, the *Bache*, the *Isis*, the *Explorer*, and the *Patterson* (temporarily renamed the *Forward*). Under authority of the act of Congress, section 8557, Compiled Statutes (R. S. 4686), the President is authorized to transfer such vessels, boats, and auxiliary ships or any of them which are not necessary to the needs of the Navy to any other executive department of the Government that has need for such vessels. Acting under this authority, the following vessels of the Navy Department were transferred to the service and jurisdiction of the Coast and Geodetic Survey: *Natoma*, April 9, 1919; *Wenonah*, April 12, 1919; *Onward*, April 19, 1919; *Ranger*, April 28, 1919; *Arcturus*, May 5, 1919.

The following table gives a condensed statement of the vessels at the disposal of the Coast and Geodetic Survey within the fiscal year:

Name of vessel.	Transferred to Coast and Geodetic Survey by Navy.	Loaned to Coast and Geodetic Survey by Philippine Government.	Owned by Coast and Geodetic Survey at beginning of fiscal year.	Sold during the fiscal year.
Arcturus.....	I			
Bache.....			I	
Cosmos.....			I	
Explorer.....			I	
Fathomer.....		I		
Hydrographer.....			I	
Isis.....			I	
Matchless.....			I	I
Natoma.....	I			
Onward.....	I			
Pathfinder.....			I	
Ranger.....	I			
Patterson.....			I	
Romblon.....		I		
Surveyor.....			I	
Wenonah.....	I			
Total.....	5	2	9	I

Transferred from Navy.....	5
Loaned by Philippine Government.....	2
Owned by Coast and Geodetic Survey.....	9
Total.....	16
Sold during the year.....	I

Total vessels at disposal of the Survey at end of fiscal year..... 15

The following statement is instructive as to the size of the vessels now operated by the bureau:

	Gross tonnage.		Gross tonnage.
Surveyor.....	1,000	Explorer.....	335
Pathfinder.....	690	Wenonah.....	240
Patterson.....	500	Ranger.....	219
Arcturus.....	456	Onward.....	157
Fathomer.....	431	Matchless.....	118
Romblon.....	411	Hydrographer.....	116
Isis.....	377	Natoma.....	112
Bache.....	370		

Summarized, the hydrographic accomplishments during the fiscal year are as follows:

	Square statute miles.
Ship hydrography.....	784.2
Launch hydrography.....	89.1
Wire-drag surveys.....	510.6
Revision surveys.....	82.0

Last year Congress authorized a nominal extra compensation to employees of the Bureau of Lighthouses stationed on lightships when they are engaged in making current observations for the Coast and Geodetic Survey. Under this arrangement observations were begun as soon as instruments could be procured and installed on the various lightships. Within the year such observations were made on 23 different lightships stationed on both the Atlantic and Pacific coasts.

Short series of current observations were made at 57 different stations on both the Atlantic and Pacific coasts.

Tidal observations were made throughout the year at 12 permanent tidal stations, 9 on the Atlantic and Gulf coasts, and 2 on the Pacific coast. Besides the tidal observations at the permanent stations, important observations were made at 44 different stations on both coasts of continental United States, and on the coasts of Alaska and the Philippine Islands. In connection with the hydrographic work, 96.7 square miles of topography were executed.

Primary triangulation was executed from the ninety-eighth meridian, in the vicinity of Waco, Tex., to Robeline, La. The length of this scheme is 255 miles, and an area of 3,570 square miles was covered. Secondary triangulation was run from Sanford, N. C., to the vicinity of Madison, N. C. The length of the scheme is 120 miles, and the area covered is 1,700 square miles. Secondary triangulation was also run from Turkey Point Light to Sandy Point Light, Chesapeake Bay. The length of this scheme is 37 miles, and the area covered is 210 square miles.

Tertiary triangulation was executed as follows: Morro Bay, Calif.: Length of scheme, 5 miles; area covered, 8 square miles. Key Biscayne in the vicinity of Miami, Fla.: Length of scheme, 15 miles; area covered, 42 square miles. Vicinity of Charleston S. C.: Length of scheme, 14 miles; area covered, 27 square miles.

A primary traverse was run from Vaughan, N. C., to Blaney, S. C. The length of the line is 235 miles. Another primary traverse was run from Wilmington to Sanford, N. C. The length of this line is 125 miles.

One arc of reconnoissance extends from the vicinity of Waco, Tex., eastward to Robeline, La. The length of this reconnoissance is 255 miles. Another reconnoissance, 50 miles in length, was run in the vicinity of Prescott, Ariz. A line of reconnoissance, also 50 miles in length, was run in the vicinity of Richfield, Utah.

There were 1,190 miles of precise leveling run during the fiscal year 1919. Magnetic observations were made during the year at 77 stations in 11 States, of which 34 were new primary stations, 17 auxiliary stations, 22 repeat stations for the determination of secular change, and 4 new stations in old localities. The regular observatories of the bureau at Cheltenham, Md.; Vieques, P. R.; Tucson, Ariz.; Sitka, Alaska; and near Honolulu, Hawaii, were in operation throughout the year.

Needs of the Survey to Better Accomplish its Field Work.

The end of the fiscal year finds the Survey with a fleet of 15 vessels, a truly considerable number when compared with those available in previous years and probably more than has ever been at the disposal of the bureau at any one time in its history. This comparatively large number of vessels is due to the fact that five vessels have been transferred to the bureau from the Navy Department under authority of the Executive order of May 24, 1919. These five were part of a number of vessels that the Navy Department had acquired to meet the temporary naval need for patrol boats, etc., during the war. Even with these additions from the Navy Department, however, the condition of the Survey's fleet is unsatisfactory. While there are numbers, there are inefficient units. When it was learned that the Navy had vessels that could be transferred, a board of Coast Survey officers was appointed to consult with the proper officials of the Navy Department to learn what vessels were available for transfer that were suited to the needs of the Survey. After a thorough examination of all the vessels that the Navy Department had available for

transfer, the board recommended that the five vessels above named be taken over. These vessels were accepted not because they are wholly suited for our work, but because they are the best means to an end at the present time. I feel that we have a great responsibility in meeting the marine needs of this country in finding and charting the dangers to navigation. The need is so pressing that we are confident that we are justified in doing what can be done with these vessels turned over by the Navy Department, though at an overhead cost considerably more than if vessels designed for the use of the Survey could be had.

The vessels we have thus acquired, after a careful investigation of those available, can not be efficiently operated as surveying vessels. Ship hydrography can not be economically carried on with a vessel that is too large, because too large a complement of officers and men is required, nor can the work be done with safety with a vessel that is too small, because she can not live through the severe weather that will be met. Furthermore, the character of the area to be surveyed seldom permits clean-cut classification, so that it can be determined before hand that this portion of it will be done by vessel and that by launches. Greater and more economical progress is made if the vessel is equipped to carry launches on her deck, and when the field of operation is reached the launch hydrography (in waters too shallow for the vessel to operate) is done in conjunction with the ship hydrography. Thus the entire area is covered by the same party during the same season.

There are two classes of ship hydrography: Offshore, such as that off the coasts of California, Oregon, and Washington, out to the 1,000-fathom curve. The other class is known as combined hydrography, such as that along the coast of Alaska, where there are many areas of which the deeper water hydrography must be done by a vessel and the waters inshore by launches.

The particular reasons why the yachts that we have obtained from the Navy Department are not suitable for either of these classes of hydrography are these: The offshore hydrography that must be done by ships along the coast of Washington, Oregon, and California out to the 1,000-fathom curve extends a general average distance of 30 miles from shore. Along these coasts the harbors of refuge are few and far between. Furthermore, the storms encountered within the area that must be surveyed are generally very severe. To buffet the storms that will surely be encountered a staunch sea-going vessel is required. The yachts now in our pos-

session have neither the strength required of hull nor machinery to stand the strain to which they would be subjected in these storms. Furthermore, if they were staunch enough for this outside work, they have not the fuel capacity to make it economical to operate them there. Too much time would have to be expended in running to the widely separated ports to obtain fuel supplies. This class of hydrography is done by running lines of soundings at right angles to the shore to and from the shore out to the 1,000-fathom curve. If a vessel only has fuel capacity to enable her to make but a few trips from the shore out to the 1,000-fathom curve and back to shore and then she must abandon her work and steam some hundreds of miles to a port to obtain a fresh supply of fuel, it is readily seen that there is an enormous loss of time, and consequently a great overhead cost to carry on this class of surveys with such a vessel. Vessels properly designed for this work are oil-burning and have a cruising radius of several thousand miles.

The other class, known as combined hydrography, covers areas where for the sake of economy the ship hydrography and the launch hydrography should be executed at the same time. The vessels that came to us from the Navy Département were yachts. They were built for speed and along narrow lines. They neither have the deck room for the storage of launches or for installation of hoisting apparatus for hoisting them aboard the vessel, nor the stability to carry the apparatus.

It seems to be the impression that there is no justification in our asking for appropriations for new vessels especially designed for the work of this bureau so long as there would be surplus vessels after the war; but such views are erroneous. A great public need would be more quickly met, and in the long run dollars that come from the Public Treasury would be saved if proper surveying vessels were provided for this bureau. It costs practically as much in personnel, food, fuel, and supplies to operate an inefficient vessel as it does to operate an efficient one. As it is, we will make what progress we can at a very considerable loss of efficiency in picking here and there sheltered waters where these vessels can be used, and equip the larger ones with as many launches as they will carry, probably not more than two, so that the vessel hydrography will progress more rapidly than the launch hydrography and delays will be enforced in regions where combined vessel and launch hydrography are necessary. There is as much necessity for vessels of special design for making surveys

as there is for use as tugs, ferries, lightships, and for freight or passenger vessels.

In 16 years, or from 1903 to 1919, but one effective appropriation was made for vessels for the Coast and Geodetic Survey, and that was for the fiscal year ended June 30, 1916, when the sum of \$289,000 was authorized for two new vessels, including their equipment. Through this appropriation we procured two vessels, one especially designed and built for a surveying vessel, and the other was purchased. For the fiscal year ended June 30, 1919, an appropriation was made in the following words: "For one new vessel, including equipment, to cost not exceeding \$354,000, \$50,000."

The question was submitted to the Comptroller of the Treasury whether there was authority to enter into a contract for the construction of a vessel to cost not exceeding the limit mentioned. The Comptroller held that the legislation did not in specific terms declare that a contract could be executed in excess of the amount appropriated, and therefore such a contract would be in violation of the act of June 30, 1906.

We have never had the vessels and personnel to bring the surveys of our waters up to a proper standard. The charts of Alaskan waters are incomplete, and the information shown on many of them is from exploration surveys by the Russians before Alaska was acquired by the United States and with a lack of exactness that would not be tolerated at the present time. The charts of the waters of the three Pacific Coast States do not contain sufficient information for offshore navigation and many of the charts of the Atlantic coast and Gulf coast of the United States are lacking in the same respect. And this should be borne in mind, that heretofore the vessels that plied our waters have been largely of foreign registration, and, therefore, losses on account of inadequate surveys have been borne to a considerable extent by other countries than ours, but that the war has brought about a great stimulation of shipbuilding in this country so that our vessels have increased from 26,397 with a gross tonnage of 8,871,037 on June 30, 1917, to 27,513 with a gross tonnage of 12,707,300 at the end of the fiscal year 1919. What is more significant still is that the increase of our merchant fleet has been not in small coasting craft, but ships of a size and type adapted to ocean service. While on July 30, 1914, just before the outbreak of the great war, our seagoing merchant ships of 1,000 gross

tons or over numbered only 755, of 2,128,731 gross tons, these vessels of more than 1,000 gross tons number on June 30, 1919, no fewer than 2,058, of 7,300,022 gross tons, or a net gain of more than 5,000,000 tons in vessels capable of ocean navigation.

In the sundry civil bill for the fiscal year ended June 30, 1919, the sum of \$62,500 was appropriated for wire-drag launches, including their equipment for the Coast and Geodetic Survey. Out of this appropriation four 60-foot launches have been built and equipped and three 30-foot tenders. One 30-foot tender was purchased.

While these launches have been in commission but a very short time, they have already demonstrated their efficiency in carrying on our wire-drag surveys. They are trim vessels, with sufficient strength to propel the wire drags and yet economical of fuel consumption. They are especially designed for this class of work, and therefore have the proper amount of space, and in right place, for storing all the necessary equipment and implements for making wire-drag surveys. They are far superior to the weaker, lumbering fishing vessels that have been hired heretofore for pulling the wire drag and which we have been forced to alter in order to install the wire-drag equipment, reels, engines, etc. With this demonstrated efficiency and economy that has resulted from the use of these vessels especially designed for this work, there is the stronger reason that such vessels should be utilized for carrying on all our wire-drag surveys. The wire-drag vessels that have been built for us out of the appropriation for 1919 are sufficient to operate two wire-drag parties. There are four regions where the wire-drag survey only is capable of finding the hidden, underwater dangers to navigation. These are all along the coast of New England, and Long Island Sound down to the entrance to New York Harbor. In this region are found the glacial deposits of boulders left beneath the waters bordering the coast. The second general region is the coast of Florida from Palm Beach southward around the southern shores and up to the neighborhood of Cedar Keys. In these waters the coral reefs are dangers to navigation. Some of these reefs are in the form of small islands, known locally as keys, while others are entirely submerged and are grave menaces to navigation. While coral reefs are characteristic of all these waters, the regions where wire-drag examinations are most urgently needed are in the vicinity of Key West and to the westward from there and then northward through the channels that

commercial vessels take in and out of the Gulf from Mobile, New Orleans, etc. The third region where wire-drag surveys are required is in the coral-infested waters of Porto Rico and the Virgin Islands. The fourth general region where wire-drag surveys are required is along the coast and through the passages of southeastern Alaska. The danger to be found here is the pinnacle rock, which is found in the form of a narrow needle-like rock that extends from a very great depth to very near the surface of the ocean. Ordinary soundings with the lead and line are of little avail in finding these pinnacle rocks and, indeed, are often quite deceptive in that such soundings show a very considerable depth and give assurance of safety, while danger may be at hand. Instances are known where the pinnacle rocks come to within a very short distance of the surface of the water, while soundings showed depths of hundreds of feet in their immediate neighborhood. There is one other small area where the wire drag should be used. This is at the Atlantic entrance to the Panama Canal. The total area in square statute miles of these four general regions yet to be covered by the wire drag is 54,319.

From this it follows that two wire-drag parties that can be operated with the modern wire-drag vessels that we now have can only accomplish a fractional part of the wire-drag work that remains to be done. In the belief that the remedy should be applied where the danger is greatest, one of these parties is operating in Long Island Sound and the other off the coast of Maine. Wire-drag work can be effectively carried on in these waters from about the 1st of April until the close of November.

We have acquired from the Navy two fairly large power launches. While these have not been built for wire-drag purposes, we believe that with some alteration they will fairly answer for this purpose. These will be used in Alaskan waters. The wire drag requires two power launches, one at each end of the drag. These launches are too large to be used both on the same drag. A very efficient drag would be formed by using one of these launches acquired from the Navy and one of the type of those that have been built for us out of the appropriations for 1919. Therefore what is needed is four additional 60-foot launches of the type of those built out of the appropriation for 1919. Two of these in conjunction with the two launches acquired from the Navy would make up two wire-drag parties for the Alaskan waters, and the other two would provide a wire-drag party for the coast of Florida.

There is more wire-drag work than can be completed by the five wire-drag parties that would be thus provided within the lifetime of the launches, a period of about 10 years. After that time the upkeep would be excessive.

Another need of the field service of the bureau is an investigation of the possibilities of the use of the aeroplane in making topographic surveys and hydrographic examinations, as well as revision surveys. Aeroplane photographs were used to a very great extent during the war in locating military features of the enemy. The same principle can be used in surveying and mapping, but a large amount of research work will have to be done before the aeroplane photograph will give the accuracy required of the highest grade of surveying done by the Coast and Geodetic Survey.

It is a very difficult matter to keep the topographic features up to date on the 700 charts of the United States Coast and Geodetic Survey with the old methods, but it is possible in many cases and especially in a flat country, to make very rapid revision of the shore line and adjacent land areas by means of photographs taken from aeroplanes.

The mapping of the country adjacent to the shores where there is considerable relief is at present not practicable from the aeroplane on account of the great amount of work that would be involved in reducing the photograph to the map. It is believed that methods will be developed by which this will be done more expeditiously, and then there will be no limit to the character of terrain on which the aeroplane can be used for surveying.

It must not be supposed that the aeroplane can entirely supersede the usual methods of surveying. We shall still need triangulation and traverse to give the fundamental control for the work, and much planetable work will have to be done to locate topographical features which may be used in the control of the position of the aeroplane photographs. It is also probable that the planetable will still be the method for placing the contours on the map. While it is possible to obtain some idea of the relief of the country from overlapping aeroplane photographs, at the same time the problem of placing contours accurately on the map is one which will be difficult to solve. The office expense of contouring a map from aeroplane photographs will undoubtedly be greater than by an instrumental party working in the field, if the contouring is to be of a high grade of accuracy. The most promising field for surveying and mapping from an aeroplane is

over flat country, or country with low reliefs, and in revision surveys where the contouring has already been accurately done. The changing features are shore lines, woods, roads, bridges, etc. These features can be readily placed on the old map by fitting in the new features shown on the photograph.

What seems to be most desirable at present is that we should have a research laboratory connected with the air service of the Army or the Navy in which various methods and instruments might be tested. Such a laboratory would preferably be in the vicinity of Washington, where the Government survey and mapping organizations are located.

War Work of the Coast and Geodetic Survey.

The Coast and Geodetic Survey bore an important burden during the war, both in the field and in the office. All told, 268 men drawn both from the field and the office took part in the war. These were drawn from all ranks of the employees of the bureau, ranging from the Superintendent to temporary men employed by the field parties.

The bureau contributed five of its survey vessels to the fleet operated by the Navy. One of those vessels, the *Surveyor*, was employed on convoy duty to and from Mediterranean ports. While on one of these trips the convoy was attacked by two German submarines, one of which was the famous *U-39* which sunk the *Lusitania*. The *U-39* fired a torpedo which grazed the bow of the *Surveyor* and was visible from the deck of that vessel. The wake of the submarine was picked up by the *Surveyor* and she was able to get in a position for favorable discharge of the depth charge. As the *Surveyor* was unable to leave the convoy, she was unable to return and finish the submarine, but did succeed in disabling it to the extent that the submarine was compelled to enter Cartagena, Spain, and intern there. Another vessel of the bureau, the *Isis*, was on duty at New York as flagship of the commandant of squadron 2, cruiser force, from November 16, 1917, to October 14, 1918, and was on duty at Yorktown and Hampton Roads as flagship of division 4, battleship force 1, from October 15, 1918, to April 1, 1919. A third vessel, the *Bache*, was assigned to squadron 5, fifth district, and performed general salvage work, outside patrol, and guardship duty off Virginia Capes. Her primary duty was identification and passing of all inbound and outbound vessels. She was the means of communication between naval authorities and these vessels. She handled mail, gave medical assistance to

passing vessels, and performed important salvage operations. Two other vessels of the bureau were assigned to patrol duty in Alaskan waters. They were the *Explorer* and the *Patterson* (re-named the *Forward*).

Besides this direct assistance to the military branches of the Government by the contribution of men and vessels, the Coast and Geodetic Survey rendered valuable service to both these branches through its field and office force. In the field, assistance consisted of furnishing certain control for maps in critical areas selected by the chief of military mapping of the Corps of Engineers of the Army. These areas were in Texas, Georgia, Florida, South Carolina, North Carolina, and Virginia. The work was chiefly triangulation, traverse, and leveling. Special hydrographic examinations were made by means of the wire drag at points designated by the Navy Department. Among such were the wire-drag surveys in Long Island Sound and in York River (Chesapeake Bay). An extensive wire-drag examination was made of the waters of the vicinity of Eastport, Me. Besides this, surveys were made for the location of points for naval fire-control experiments, the reestablishment of the speed trial course at Lewes, Del., for torpedo-boat destroyers, the location of the Port Jefferson trial course in Long Island Sound, and the Block Island (R. I.) trial course.

STEAMBOAT-INSPECTION SERVICE.

(GEORGE UHLER, *Supervising Inspector General*.)

Organization.

There were the following positions in the Steamboat-Inspection Service at the close of business on June 30, 1919:

At Washington, D. C. (central office force):

Supervising Inspector General.....	1
Deputy Supervising Inspector General (who is Acting Supervising Inspector General in the absence of that officer).....	1
Clerks.....	10
Messenger.....	1
	13

In the Service at large (field force):

Supervising inspectors.....	11
Traveling inspectors.....	3
Local inspectors of hulls.....	48
Local inspectors of boilers.....	48
Assistant inspectors of hulls.....	82
Assistant inspectors of boilers.....	83
Clerks to boards of local inspectors.....	97
	372

Total..... 385

Attention is specially directed to the small size of the central office force.

Sixty-four permanent positions were added to the Service during the year, as follows:

One supervising inspector at Seattle, Wash., and one traveling inspector with headquarters in the office of the Supervising Inspector General.

One clerk in the office of the Supervising Inspector General, Washington, D. C.

The following assistant inspectors: Two assistant inspectors of hulls and three assistant inspectors of boilers, San Francisco, Calif. Two assistant inspectors of hulls and two assistant inspectors of boilers, Cleveland, Ohio. One assistant inspector of hulls and two assistant inspectors of boilers, Philadelphia, Pa.; Seattle, Wash.; and Portland, Oreg. Two assistant inspectors of hulls and one assistant inspector of boilers, New York, N. Y. One assistant inspector of hulls and one assistant inspector of boilers, Boston, Mass.; Milwaukee, Wis.; Los Angeles, Calif.; New London, Conn.; and Portland, Me. One assistant inspector of hulls, Baltimore, Md.; New Haven, Conn.; and Norfolk, Va. And one assistant inspector of boilers, Chicago, Ill.; Jacksonville, Fla.; and Toledo, Ohio.

Twenty-four additional clerks were added in the Service at large.

Summary of Activities and Statistics.

Following is a summary of activities and statistics for the fiscal year 1919:

The force inspected and certificated 7,407 vessels, with a total gross tonnage of 11,562,166, of which 7,134 were domestic vessels, with a total gross tonnage of 9,128,911, and 273 were foreign passenger steam vessels, with a total gross tonnage of 2,433,255. Of the domestic vessels there were 5,880 steam vessels, 709 motor vessels, 17 passenger barges, and 528 seagoing barges. There was an increase of 392 in the total number of vessels inspected and an increase of 3,097,470 in the total gross tonnage of vessels inspected, as compared with the previous fiscal year. Letters of approval of designs of boilers, engines, and other operating machinery were granted to 23 steam vessels, with a total gross tonnage of 672. There were inspected for the United States Government 79 hulls and 2,337 boilers. There were 2,053 reinspections of passenger and ferry steamers.

Licenses were issued to 28,069 officers of all grades. There were examined for visual defects 9,753 applicants for license, of whom 108 were found color blind or with other visual defects and rejected. Certificates of service were issued to 8,796 able seamen, and 760 were rejected. Certificates of efficiency were issued to 3,910 lifeboat men, and 344 were rejected.

Steel plates for the construction of marine boilers to the number of 35,427 were inspected at the mills, and a large amount of other boiler material was inspected. There were examined and tested 435,337 new life preservers, of which number 8,311 were rejected.

The total number of accidents resulting in loss of life was 194. The total number of lives lost was 543, of which 202 were passengers. Of the lives lost, 170 were from suicide, accidental drowning, and other causes beyond the power of the Service to prevent, leaving a loss of 373 as fairly chargeable to accidents, collisions, foundering, etc. There was an increase of 43 in the number of lives lost, as compared with the previous fiscal year. Passengers to the number of 323,317,657 were carried on vessels required by law to make report of the number of passengers carried. Dividing this number by 202, the total number of passengers lost, shows that 1,600,582 passengers were carried for each passenger lost. The number of lives directly saved by means of the life-saving appliances required by law was 2,349.

Reconstruction.

One of the great problems to which the Nation must give its attention is that of transportation, and, so far as transportation by water is concerned, the Steamboat-Inspection Service must necessarily have an important part, because vessels of the American merchant marine are subject to the inspection of that Service. Therefore, if there can be any improvements made in the methods of administration, those improvements should be made now, so that the American merchant marine may not only be placed in the first rank of all the nations but that it may remain there. There will be briefly discussed the proposition of an improvement to be made in the approval of hull and boiler construction, the question of the licensing of men, and changes that should be made in the law with reference to boiler pressures.

Centralization of Approval of Hull and Boiler Construction.

It is important at this time to improve the methods of the approval of hull construction. This could be accomplished by

creating in the office of the Supervising Inspector General a corps of experts, whose business it would be to examine and pass upon blue prints and specifications submitted by persons purposing to build ships. When approved, the blue prints would be referred to the respective boards of local inspectors in whose district the vessel or vessels were to be built. The inspectors' duty would be to see that they were built in accordance with the blue prints. The result of this procedure would be to standardize in a large measure hull construction and hull inspection.

Although the regulation adopted by the Board of Supervising Inspectors in regard to the stability of vessels provides that when inspectors have any reason to question the stability of any vessel under their jurisdiction they shall require the owners of the vessel to make inclining tests on such vessel under the supervision of expert naval architects provided by this Department, the Service does not discover the condition until after the vessel is navigated and until after the risk has been assumed by those who travel upon the ship. It is proposed, therefore, to have enacted by the Board of Supervising Inspectors, without delay, a rule that will require a stability test of all vessels that are built, the tests to be conducted under the direction of naval architects provided by this Department. While this is a narrower proposition than that of the creation of a board of naval architects working under the direction of the Supervising Inspector General, it is one that will meet and possibly control the situation until proper action can be taken to provide for the corps of naval architects.

It is also quite as necessary that boiler construction should be approved in the office of the Supervising Inspector General by a corps of expert engineers in the same manner as hull construction.

It will be clear that, in order to have that uniform administration of the law with reference to the approval of hull and boiler construction, with which the Supervising Inspector General is charged, there must be centralized authority.

Examination of Applicants for Licenses.

It has been suggested to the Steamboat-Inspection Service that, if uniform methods were used in examining applicants, a better class of licensed officers would be obtained, and that the procedure of the Civil Service Commission should be followed, so fixing one general practice in this respect. On the other hand, it may be stated that the United States covers a vast expanse of territory, representing many varied local conditions, and it is felt

that, in the matter of examining applicants, the local inspectors are better informed than any central authority could ever be. Furthermore, there would be considerable congestion in connection with obtaining licensed officers for the ships. These men do not come for examination once or twice a month, but usually every day, and the local inspectors adjust their business so as to examine them when they appear. As a result, the Service has been able under war conditions to obtain licensed officers for the rapidly increasing number of ships.

Boiler Pressure.

The rules of the Steamboat-Inspection Service are not up to date with reference to boiler pressures, proper credit is not given for the riveting plan above double riveting, and improvements can be made with reference to hydrostatic pressure. The Service, therefore, caused to be drafted a bill looking to the amendment of sections 4433 and 4418, Revised Statutes. That bill is Senate bill 574.

The purposes of the proposed amendments in section 4433, Revised Statutes, are, first, to do away with the obsolete rule contained in the law, prescribing a working steam pressure for single-riveted joints, without taking into consideration the percentage strength of the riveted joint, and allowing 20 per cent additional pressure for double-riveted joints, but not allowing a greater working pressure for triple-riveted and quadruple-riveted, etc., lap and butt joints. For these, greater working pressure should be allowed on account of the greater strength of the triple-riveted and other similar joints.

This greater allowable working pressure for the stronger forms of riveted joints has for years been desired by boiler users.

The present law furnishes no incentive for building boilers with stronger kinds of joints than double-riveted joints that will carry a greater working pressure with but slight increase in the amount of material required for boiler shell.

Further, by placing the authority to prescribe rules for working pressure on boilers with the Board of Supervising Inspectors, with the approval of the Secretary of Commerce, that board will prescribe rules that will meet the various conditions of boiler construction, taking into consideration the percentage strength of the various kinds of riveted joints.

Rules for calking would be prescribed by the Board of Supervising Inspectors in connection with rules for riveted joints.

The purpose of the amendments in section 4418, Revised Statutes, is in order to leave with the Board of Supervising Inspectors the authority of determining the hydrostatic test in connection with the rules for riveting that would be adopted by the board and approved by the Secretary of Commerce.

The proposition of giving the Board of Supervising Inspectors the authority to make modern its rules with reference to boiler pressures is consistent with the whole theory of reconstruction. It is absolutely necessary that it be adopted, in order that the rehabilitation of the American merchant marine may go forward without delay.

BUREAU OF NAVIGATION.

(EUGENE TYLER CHAMBERLAIN, *Commissioner*.)

American shipping registered for the foreign trade and enrolled and licensed for the coasting trade, including the fisheries, on June 30, 1919, comprised 27,513 vessels of 12,907,300 gross tons, compared with 26,711 vessels of 9,924,518 gross tons on June 30, 1918, an increase of 802 vessels and 2,982,782 gross tons. The following statement shows the total of our tonnage at the close of each of the past six fiscal years and indicates the great changes which have taken place within that period:

June 30—	Foreign trade.	Coasting trade.		Total.
		Great Lakes.	Sea and rivers.	
1914	1,076,152	2,882,922	3,969,614	7,928,688
1915	1,871,543	2,818,000	3,699,886	8,389,429
1916	2,191,715	2,760,815	3,517,119	8,469,649
1917	2,446,399	2,769,824	3,654,814	8,871,037
1918	3,603,706	2,708,523	3,612,289	9,924,518
1919	6,669,726	2,635,680	3,601,894	12,907,300

These figures show for the dates named the gross tonnage of ships registered, enrolled, or licensed; but they must not be taken unqualifiedly as the evidence of commercial growth. Of the total tonnage 3,827,201 gross tons were vessels over 1,000 tons owned by the Shipping Board and represent appropriations by Congress and the sacrifices made by the American people to win the war. The figure just stated does not fully represent the extent of the Government's ownership in ocean carrying, for on June 30, 1919, the War and Navy Departments were operating mainly as troop transports 405,021 gross tons of ships, including

most of the former German merchant ships seized in American harbors. These ships are not under register or enrollment on account of their temporary employment, but in any adequate statement of our maritime resources should be added to the 3,827,201 gross tons of Shipping Board ships.

Since 1914, as during the Napoleonic wars, American ships have appeared in large numbers in ports all over the world. Of the total increase in our shipping since June 30, 1914, almost 5,000,000 gross tons, nearly all has consisted of ocean-going steel steamers of 1,000 gross tons or over, of which on June 30, 1914, we had 429 of 1,589,733 gross tons and on June 30, 1919, 1,436 of 6,072,901 gross tons. Though effected by war causes, this growth is in the direction of normal mercantile-marine development. The increase, on the other hand, in wooden seagoing steamers of over 1,000 gross tons from 8 of 10,595 gross tons on June 30, 1914, to 293 of 693,541 gross tons on June 30, 1919, is to be counted in large measure as among our sacrificial efforts to win the war.

The vessels built in the United States and documented as vessels of the United States during the fiscal year numbered 1,953 of 3,326,621 gross tons, compared with 1,528 of 1,300,868 gross tons during the previous fiscal year. The standard by which the output of the United States should be measured is that of the rest of the world during prewar years. During the calendar year 1913, the year of the greatest prewar output, Lloyd's returns show a total of 1,932,153 gross tons launched in the United Kingdom, her greatest output, and 1,124,276 gross tons launched by the rest of the world, excluding the United States, a grand total of 3,056,429 gross tons. During that year the United States launched 276,448 gross tons. In a word, the people of the United States, mainly through war loans and war taxes, have expanded the shipbuilding industry until in tonnage output it has equaled the world's former annual commercial output of shipping. It is quite evident that this great industry can be maintained only if it is in a position to meet not merely the requirements for new tonnage of American shipowners, but also the requirements of shipowners of other nations less favorably placed by natural causes and legislative support than are we for shipbuilding.

World's Tonnage.

The world's merchant tonnage is larger now than at any other time in history. Lloyd's Register for 1914 stated the world's

total tonnage (vessels over 100 gross tons) at 49,089,000 gross tons, and the same authority for 1919 gives the world's total as 50,919,000.

A comparison of the volume of tonnage will be seriously misleading unless the quality of the tonnage also is considered when estimating the work it can now perform. About two-thirds of the tonnage now afloat was built before the war and has undergone not merely five years of ordinary wear and tear, but, in addition, the strain of constant service, with limited repairs hastily made. Furthermore, submarine warfare was directed against the best types of passenger ships, and the loss of ocean liners was especially heavy. This has been partly, not wholly, made good by the transfer of the former German passenger fleet to the flags of the maritime powers. The repair and restoration to a fair measure of usefulness of the ships built before the war has been undertaken, but it has involved temporary withdrawal of considerable tonnage.

The ships built during the war, taken as a whole, are inferior to the ships built before the war. This statement involves no reflection upon shipbuilders and shipowners. Indeed, they have had much less authority than usual over the plans or methods of ship construction, Government here and abroad having assumed virtually entire control over the building and operation of ships. The aim of Government generally has been to turn out the greatest volume of tonnage in the shortest possible time. The average speed of ships built during the war was below the average of pre-war construction. Very few passenger ships were built, and the urgent need for engines involved the building of cargo boats slower on the average than those building in 1914. The average size of ships was also smaller, because many of the yards formerly engaged in building larger ships were employed during the war on naval construction, and many of the new yards hastily established could turn out only smaller ones. Finally, hurried workmanship by labor in process of training can not be expected to produce the best results. The new oil-burning ships have, however, plain advantages in many trades over coal-burning ships.

These factors in the situation, though not easy to reduce to mathematical form, must be weighed in drawing conclusions from a comparison of the world's total tonnage now and before the war.

A true guide for present purposes would be a statement of the tonnage clearances of shipping in the world's foreign trade by sea, but such a statement is not now available.

The total clearances with cargo, however, from the ports of the United Kingdom for ports in foreign countries (excluding Germany) and British possessions during the seven months ended July 31, 1919, were 19,286,256 net tons, compared with 13,114,208 net tons for the corresponding period in 1918 and 36,261,475 net tons for the corresponding period in 1914. The tonnage clearances from the United States for Europe, Asia, Australia, Africa, and South America for several fiscal years are at hand, stated in net tons (each of 100 cubic feet of closed-in ship space). The following table shows the shipping actually available and employed for cargo and passengers clearing in overseas trade from the United States during the fiscal year ended June 30, 1914, the year of our greatest clearances before the war, during the year ended June 30, 1918, and the year ended June 30, 1919:

For—	1914	1918	1919
Europe.....	16,144,118	14,263,547	16,431,123
South America.....	2,429,659	2,237,976	2,705,365
Asia and Oceania.....	1,990,105	2,095,324	2,529,998
Africa.....	406,457	235,649	393,971
Total.....	20,970,339	18,832,496	22,060,457

From the clearances for Europe are excluded those for Germany, of which in 1918 there were none and in 1919 only 9,734 net tons, but 3,902,073 net tons in 1914. The figures for 1918 and 1919, however, do not include the shipping employed in transporting troops and our munitions of war, which greatly exceeded the tonnage clearances in previous times for Germany.

In ordinary times, on account of the greater bulk of our exports, ships usually clear from the United States with ample cargoes, while many enter in ballast or with part cargoes. In 1914, for example, 15 per cent of the shipping from Europe entered the United States in ballast, and at the present time the proportion is much greater, though the precise figures are not at hand. To a greater extent than usual, accordingly, foreign consumers must pay high freights on their imports from the United States, for those freights must often cover the charges of the voyage in ballast to America. Evidently such conditions can not long continue.

So far as the production of shipping to meet the situation is concerned, good progress is shown by Lloyd's report that on June

30, 1919, the merchant ships under construction in the world's yards aggregated 8,017,767 gross tons, of which 3,874,143 gross tons were building in the United States and 2,524,050 in the United Kingdom. The largest tonnage building under prewar returns was 3,445,000 gross tons reported by Lloyd's for June 30, 1913.

The growing share of American shipping in the overseas trade of the United States is shown by the following statement of the net tonnage of clearances of American ships for overseas during the fiscal years ended June 30, 1914, 1918, and 1919:

For—	1914	1918	1919
Europe.....	439,261	1,671,081	2,535,265
South America.....	192,479	823,354	1,290,248
Asia and Oceania.....	100,833	287,386	494,548
Africa.....	4,263	49,460	99,034
Total.....	736,836	2,831,281	4,419,095

As in the preceding statement of total net-tonnage clearances (which included American), these figures do not include Germany, to which in 1914 the American clearances amounted to 8,406 net tons, none in 1918, and 9,734 net tons in 1919.

The net tonnage of many merchant ships converted into Army transports are not included in the figures above.

Main Maritime Facts.

The main facts in the general maritime situation at this time are asfollows:

1. The world's merchant tonnage is the largest in history, but its average efficiency is below that of 1914 for inherent reasons in construction and for extraneous reasons such as port congestions, labor troubles, and management. The world's net gain in steam tonnage is 2,500,000 gross tons, the gain of the United States 7,600,000 gross tons, the loss of the rest of the world 5,100,000 gross tons.

2. The merchant tonnage now under construction is more than double the prewar output and is of increasing efficiency in the main.

3. The volume of the world's ocean-borne commerce is less than in normal times and will continue less until industrial and agricultural Europe has more fully recovered from the effects of the war.

The proportion exports to Europe bear to the world's total sea-borne commerce is above the average, involving high ocean-freight rates.

Our maritime situation, mainly as the result of expenditures authorized by Congress equal to the book value of the whole world's merchant fleets in 1914, is as follows:

1. Our seagoing steel steam tonnage (ships of over 1,000 gross tons) on June 30, 1919, was over 6,000,000 gross tons, four times greater than in 1914, and is increasing at the rate of over 350,000 gross tons a month, equaling our best annual outputs before the war.

2. The annual output of our shipyards exceeds the greatest annual output of the world's shipyards before 1914.

3. Steel-ship building plants have been extended or established with new machinery, methods, housing, and transit accommodations equal, and in some respects superior, to those abroad.

4. American tonnage clearing in overseas trade in the fiscal year 1919 was six times greater than in 1914.

Maritime Problem.

The maritime problem now before the United States is more difficult than in former years, because we have created with public funds a vast war plant of ships and shipyards which must be readjusted to the requirements of commerce.

Few will contend that shipbuilding and ship operation can be successfully maintained and developed in this country if Government is to furnish the funds and almost exclusively control both, as for the past two years. The question of raising the money by loans and taxes for the purpose is not for the moment in mind, though evidently there is a limit to that not far off in time. The building and operation of ships are two forms of industrial activity which least of all admit of monopoly or combination. The ocean is free to those who wish to navigate it. The most ingenious legislative devices, even in war times, have not restricted the individual of any country, except an enemy, from purchasing ships where he chooses and operating them. Limitations may be prescribed and obstacles erected, but these confirm the essentially competitive nature of shipbuilding and shipowning. These occupations accordingly offer some of the best fields for individual skill, application, enterprise, and foresight and the least advantageous fields for a system of Government ownership and management in which the qualities named are more likely to be stunted than developed.

It seems clear, therefore, that the restoration of our maritime affairs to individual control and operation is desirable for the healthy development of our national life. The sooner this action is taken the better for the future of the industries, because the next two years bid fair to be the crucial years in commercial maritime development. By that time it is reasonably safe to presume that the world's ocean-borne trade will be conducted on terms of the closest and, it may be hoped, the fairest competition.

American shipyards, accordingly, should be allowed to build freely for all comers, and in the long run they will gain by the withdrawal on equitable terms of Government contracts and the substitution therefor of private contracts. We already have steel-ship building plants nearly all of which are equal to and many superior to the older plants of other countries. The past two years have developed hundreds of thousands of shipbuilders who numbered only tens of thousands before the war. The supremacy of our steel industry is unchallenged. The same general principles should be considered in relation to the fleet afloat, the ships in operation or launched. Every interest suggests that these ships be disposed of to men trained to the most effective and economical operation of ships. The industrial and commercial situation of the world is too uncertain to warrant experiments in the operation of ships which might be inviting in times of general prosperity.

There will doubtless be opportunity, and probably necessity, for some lines operated either partially or indirectly by the Government in which to provide an outlet for our commerce to points that can not be profitably reached by private enterprise until commerce with them shall have been developed. Our ocean fleet is the servant of our trade, and where that trade can not be served effectively by private enterprise the Nation, through the Government, must do its part in opening the way in which our commerce is to flow. There is room, therefore, in the ocean trade for full and free opportunity for private enterprise and for the helping hand of the Government to meet special conditions in order that our commerce and industries shall by both be adequately served.

Subdivision of Hulls.

The recommendations of the International Conference on Safety of Life at Sea, in so far as they relate to the subdivision of hulls and other structural details of ocean passenger ships, have been held in abeyance during the war, although British trans-Atlantic passenger ships have been built during the period in

voluntary compliance with those recommendations. Although during the war we confined our efforts to building cargo ships, we must now include ocean passenger ships, and the recommendations of the conference and experience gained from the past five years should be considered in making plans for such ships. The subject called for prompt action, and I have accordingly requested the American members of the construction committee at the international conference to recommend a course of action and the administrative machinery required. These gentlemen—Rear Admiral W. L. Capps, U. S. Navy; Mr. Homer L. Ferguson, president of the Newport News Shipbuilding & Dry Dock Co. and of the Chamber of Commerce of the United States; and Mr. Alfred Gilbert Smith, president of the New York & Cuba Mail S. S. Co.—are of acknowledged standing and authority. It will undoubtedly be desirable to provide for a small technical staff to be permanently attached to the Department of Commerce to consider questions of the construction of passenger ships, whether the conference regulations or modifications of them be adopted.

Shipping Commissioners.

During the year 485,796 officers and men have been shipped and discharged, included repeated shipments and discharges, by United States shipping commissioners, compared with 457,248 for 1918 and 506,941 during 1917. Collectors of customs acting as shipping commissioners at ports where those officers are not established shipped and discharged last year 37,978 men, compared with 35,131 for the previous fiscal year and 18,439 for the fiscal year 1917. The great increase in American shipping in foreign trade is not reflected in these figures, because during the war our ships were manned to a great extent by men in the Navy. These naval crews are being discharged and merchant crews provided, as contemplated by law, for merchant ships. The work of shipping commissioners is increasing, especially at the principal seaports, and it has been necessary to submit deficiency estimates to cover this increase. ♦

Navigation Receipts.

The receipts from tonnage duties during the fiscal year amounted to \$1,265,229.23 (including \$2,041.98 Philippine Islands fund and \$5,028.50 alien and penal tonnage duties and light money). The total is \$93,810.87 greater than for the previous fiscal year. The largest annual receipts from tonnage duties were \$1,454,565.83 for the year ended June 30, 1916, and during the current fiscal

year receipts from this source should become normal and approach that amount.

Receipts from navigation fees amounted to \$143,492.19, compared with \$146,508.02 for the previous year. The receipts from navigation fines and penalties amounted to \$162,146.50, compared with \$32,097.68 for the previous year. The increase is almost wholly due to the forfeiture of the steamer *Sacramento*. This ship was a former German ship which by fraud secured an American register at San Francisco and forthwith under German direction proceeded with supplies to the squadron of Admiral von Spee, off the Juan Fernandez Islands, thus enabling that squadron to sail to its destruction off the Falklands. The steamer *Sacramento* was decreed forfeited and the forfeiture compromised for \$250,000, of which \$125,000 was paid last year, and the balance is to be paid during the current fiscal year.

The total navigation receipts for the year thus have been \$1,570,867.92, compared with \$1,351,492.66 for the previous fiscal year. It may be noted that the appropriations by Congress for all branches of the Navigation Bureau amounted to \$217,045.

Radio Communication.

Under the Executive order of April 30, 1917, "to insure the proper conduct of the war against the Imperial German Government and the successful termination thereof" coast radio stations were operated by the Navy Department or closed, and the order is still in force, pending ratification of the treaty of peace. The Navy Department continued the supervision of the allotment of radio apparatus to ship and shore stations and supplied naval radio operators to many ships. The regular force of radio inspectors of the Bureau of Navigation continued to serve with our armed forces ashore and afloat, and I am pleased to add that the value of their services in many instances has been recognized by our Government and the Governments of the allies by promotion and by the award of decorations. Many of our force have now been honorably discharged from the Army or Navy and with a few exceptions have returned to the bureau.

During the past year the bureau's Radio Service made 4,243 inspections on ships subject to the radio ship act, compared with 4,341 similar inspections during the previous fiscal year and, in addition, 917 inspections of the apparatus on ships voluntarily equipped. The inspections developed 425 cases of apparatus more or less defective or of inadequate complement of radio operators.

The inspection of ship apparatus was of the first importance for security, particularly during hostilities. It was not possible with the force available to make the critical examination of apparatus preliminary to the issue of licenses to ship stations under the act to regulate radio communication and the treaty to which it gives effect. Only 250 ship stations were thus fully examined, but, in addition, provisional licenses were issued to 1,196 ship stations. In some instances the apparatus for these stations was furnished by the Navy Department and was at times necessarily incomplete or imperfect. In addition, 866 ships are equipped with wireless apparatus, requiring licenses which it has not been practicable to issue even provisionally.

This branch of the work is very much in arrears, and the laws can be carried out only by a considerable increase in the inspection force for which a deficiency estimate has been submitted to Congress. On July 1, 1915, only 897 American ships were equipped with apparatus for radio communication, while on July 1, 1919, the number was 2,312. Meanwhile the appropriation for the maintenance of the wireless-inspection service in all its branches has remained \$45,000. With the coming of peace it will be necessary not only to overcome the arrears, but to provide for regularly continuing inspection, which soon will involve three times the number of American ships subject thereto in 1915.

The total number of examinations of applicants for radio operator's license was 2,729. One thousand one hundred and twenty-four passed the examinations and received operator's licenses. In addition, the licenses of 579 operators were renewed. After years of effort, the Bureau of Navigation has secured for its license to radio operators a reputation in the technical world so that the license is sought for as an evidence of proficiency by foreign operators, as well as by our own. The bureau decided not to lower the standard of its examination and license, but to meet emergencies due to the shortage of radio operators by authorizing inspectors to allow operators with some experience, but unable to pass the examination, to go to sea under a temporary permit. At the end of the fiscal year June 30, 1919, there were outstanding 48 commercial extra first-operators' licenses, 2,436 commercial first licenses, and 610 commercial second licenses, in all 3,094 operators, a number insufficient even if all were fully employed all the time to fully man the 2,312 American ships equipped with radio apparatus on June 30, 1919. The deficiency, however, is

being partly overcome by the radio inspectors, who are instructed to give special attention to the examination of operators.

The examination and license of amateur operators and stations ceased in April, 1917. The amateur field has recently again been opened.

The volume of radio inspection will thus be very much greater than it was before the war; furthermore, the commercial radio equipment of the near future will differ in many respects from that of the past because of the improvements, developments, and inventions resulting from the intensified use of radio communication during the war. More flexible and efficient equipment will come into use, including the radio telephone. The invention and improvement of directional radio apparatus by which position may be determined, to a great extent the result of investigations by an expert in the Bureau of Standards, this Department, have a special and obvious value at sea. Improvements in the tuning of apparatus permit a greatly increased amount of traffic. Radio telegraphy in certain localities where the maintenance of wire lines is impossible for physical reasons or prohibited on account of cost must hereafter be reckoned with. The wonderful advances in aerial navigation with the use of wireless for communication between ships in the air and stations on the earth introduces another complication.

The subject of the scientific development of radio communication during the war is too technical and complicated to be set forth in detail in this report. It is mentioned as showing that operators hereafter must have a broader theoretical training and a more accurate knowledge of the radio art than hitherto, the standards of the inspection service and the scientific qualifications of the inspectors must be advanced. These considerations have led the Department to ask for a deficiency appropriation of \$55,000 to meet conditions and requirements when radio communication resumes its normal place as an instrument of commercial communication.

International Radiotelegraphic Conference.

The developments in radio communication and the great improvement in transoceanic radio communication point to the need of a revision of the International Radiotelegraphic Convention of 1912, to which the United States is signatory. The International Radiotelegraphic Conference adjourned at London with the understanding that the next conference should be held

in 1917. The war made that impossible, but all are agreed that the conference should be held as early as possible in 1920, and Congress will be asked to provide for American representation.

Load Line, Measurement, Bulkheads.

The necessity for legislation to provide for load lines on cargo vessels has been referred to in my former reports. A bill (S. 575; H. R. 3621) embodying the views of this Department has been favorably reported to the Senate and the House of Representatives. The bill enables the Secretary of Commerce to avail himself of the facilities afforded by the American Bureau of Shipping and gives that useful organization an official status, establishing relations between our Government and the American bureau similar to those between the British Government and Lloyd's Society. To give effect to the legislation, several high-grade technical experts will be needed in the Department of Commerce, and at some ports it will be necessary to provide officers competent to make the surveys preliminary to the establishment of load lines in the case of ships which are not classed by the American bureau or by other classification societies. The estimates to give effect to the load-line bill, if enacted, are being prepared.

In my report for 1917 mention was made of the need for creating in seaboard and Great Lakes shipbuilding districts a small corps of men trained to the accurate measurement of ship tonnage instead of relying upon the detail of customs inspectors. This matter has not been pressed during the war. Hundreds of ships have been built in this period from a few sets of plans supplied by the Government simplifying the work of measurement. When one ship of a certain type had been carefully measured, it was necessary merely to send blue prints and results for their guidance to customs officers in districts where other ships of the same type and dimensions were under construction. In normal times many ships are built with regard to the particular trades in which they are to engage. This is the only way in which the fullest use can be secured from them and is necessary to success in the highly competitive business of shipping in foreign trade. In time we shall return to normal conditions. The Department of Commerce will then require a force of measurers of ships. Legislation and the estimates to give it effect await surer signs of the return to normal conditions in shipbuilding than are now in sight.

With the return of normal conditions it will be necessary also to give closer attention to bulkheads and other important details of construction.

Here, too, any intelligent action by the Government will require a small technical staff in the Department of Commerce and officers at certain seaports capable of giving effect understandingly to its recommendations and conclusions.

The three subjects load line, measurement, and bulkheads involve considerations of the safety of the ship and those on board which are paramount. They involve also issues of commercial competition on equal and fair terms. For both reasons it is plainly desirable that there should be substantial accord between the maritime powers in their legislation and administrative measures. Again, conditions at present are too remote from normal to warrant the suggestion of early and formal meetings of the maritime representatives of those powers to consider measures to effect such accord. It is not, however, too early to begin those informal conversations which necessarily must go before more formal action, and the Bureau of Navigation has the general subject under consideration.

Enforcement of Navigation Laws.

During the year 1919 the various services of the Bureau of Navigation reported 8,172 violations of the Navigation Laws, the largest number acted upon by this Department since its creation. These violations resulted in the collection of \$162,146.50 as fines, the largest amount collected from this source at least during the last 25 years, due mainly to the collection of a single penalty of \$125,000 in the case before described.

The work of enforcing the law was performed through the offices of the collectors of customs, navigation inspectors, Steamboat-Inspection Service, and the Department's inspection boats. In addition to these, 56 owners of motor boats, most of them members of the United States power squadron, tendered their services and boats on Sundays and holidays at \$1 per year.

During 1919 there were 11,071 counts of passengers going on excursion steamers aggregating 7,783,791 passengers, as compared with 4,916,772 passengers for the previous year. Of this number the navigation inspectors made 7,380 counts of 6,250,948 passengers.

On 408 occasions it was found necessary to prevent more passengers going on board vessels. This involved the safety of 186,307 passengers. The navigation inspectors are employed only during the months of June, July, and August. While not counting passengers they are employed in the general enforcement of the navigation laws, especially those relating to motor boats.

During the fiscal year passenger ships on 314 voyages brought 55,603 steerage passengers to the United States, compared with 67,988 such passengers in 1918, 147,493 passengers in 1917, 154,057 in 1916, 211,057 in 1915.

Motor Boats.

The general resumption of the use of motor boats has extended the usefulness of our inspection vessels in safeguarding the lives of those using them.

The act of June 7, 1918, requiring the numbering of undocumented motor boats went into effect December 7, 1918, and is quite generally complied with, especially in those sections where we have facilities for the enforcement of the law. Up to July 1 of this year there had been numbered 91,916 motor boats. It is estimated that there are approximately 250,000 motor boats in the United States, perhaps 200,000 of which are subject to this law. For its enforcement it is essential that the Department should have additional facilities.

There have been turned over to us by the Navy Department two small motor boats used by them during the war as station patrols which are especially adapted to our service. The House Committee on Appropriations has included in the deficiency bill for 1920 a provision which will enable us to place these vessels in operation about the first of March and continue their use during the balance of the fiscal year. We will thus be able to cover with our five vessels the Atlantic and Gulf coasts, Mississippi River and tributaries, and place one vessel on the Great Lakes.

The inspection forces of the Bureau of Navigation are cooperating with the Internal Revenue Bureau in the collection of taxes imposed on the use and business of motor boats. The revenue derived from the work of these inspection boats of the Department in the collection of taxes and navigation fines should be greatly in excess of their cost of operation.

CONCLUSION.

Need for a Unified Government Commercial Organization.

Section 3 of the organic act of February 14, 1903 (32 Stat., 825), provides as follows:

It shall be the province and duty of said Department to foster, promote, and develop the foreign and domestic commerce, the mining, manufacturing, shipping, and fishery industries, the labor interests, and the transportation facilities of the United States; and to this end it shall be vested with jurisdiction and control of the departments, bureaus, offices, and branches of the public service hereinafter specified, and with such other powers and duties as may be prescribed by law.

So much of the foregoing as relates to labor interests is superseded by the organic act creating the Department of Labor. The balance remains in full force and vigor. There is no other department of the Government charged by law with the broad duty to foster, promote, and develop the foreign and domestic commerce, etc., of the United States. It is assumed that this law was meant to be taken seriously; that the duties imposed by it upon the Department of Commerce were real duties; and that it should have the authority and the responsibility of performing them. It is, perhaps, not too much to assume that the Department of Commerce was, within the sphere which is above outlined, intended to have the same authority and influence that the Treasury Department has in finance, the War and Navy Departments in their respective fields of military effort, the Agriculture Department in the field of agriculture, the Department of State in diplomacy, and, indeed, each of the other executive departments within its lawful field.

Such is, however, not the case. Other bodies exist who perform in whole or in part the duty charged by law upon the Department of Commerce. In writing frankly of the actual situation it should be premised that the matter is not discussed in any spirit of complaint, nor is there any thought of criticism of persons or of specific bodies. The subject under review is a matter of organization, and the question being discussed is whether our present organization is fitted to cope effectively with the serious commercial problems that face the country.

Any review of the commercial work of the Government must show that the absence of organization is its most conspicuous feature. There is an excess of organizations; too little system. Numerous bodies exist, functioning more or less in the same field or with direct action therein, each independent, without coordination, without liaison, without the obligation on the part of any of them to inform the others. In short, there exists in our public commercial organization very much the same condition that existed in the allied armies before unity of command was secured. It would not be questioned that before that time the commanders of the allied and associated forces were sincere, competent, and devoted men. Each, in his own separate sphere, was doing his best and trying to support his allies as fully as he could. The difficulty was, of course, that the spheres were separate. Just so it is in our Government commercial organization. Different bodies, composed of able and earnest men, function separately on

commercial subjects at home and abroad, without mutual plan, without frequent consultation, and often in entire ignorance of what the others are doing.

The War Finance Corporation is given authority to furnish credits to the extent of a billion dollars "in order to promote commerce with foreign nations." There is no doubt this function will be performed by them wisely and well, so far as the law permits; but there is no obligation to coordinate their work with that of the Department of Commerce, although this last is charged to "foster, promote, and develop the foreign and domestic commerce" of the country. The management of the War Finance Corporation has shown marked courtesy to the Department of Commerce, but there exists no close cooperation.

The Federal Reserve Board admirably performs a function of vital importance to our commerce and finance. One can only speak of it in terms of approval and admiration, but, so far as the Department of Commerce is concerned, it functions separately, without obligation of either consultation or of cooperation.

The Interstate Commerce Commission performs functions of high value in our domestic and foreign commercial life; but it performs them as a separate organization. It probably does not occur to the distinguished members of that useful body to either consult or cooperate with the Department of Commerce, or that the latter has any interests or functions in common with it.

The Shipping Board provides for the carrying of our commerce to the ends of the earth and, through its officers and representatives abroad, takes an important, if not a vital, part in our commercial activity, but the Department of Commerce is not represented upon the Shipping Board and, except as a matter of courtesy, can not influence or guide it.

The Federal Trade Commission has duties of high importance vitally affecting our domestic and our foreign trade; but no representative of the Department of Commerce forms a portion of that body, nor is there existing any obligation for that commission to function in close relation with the Department of Commerce.

The International High Commission, of which the Secretary of the Treasury is the ex officio chairman, is a composite body representing the United States and the other American Republics. It has distinctly commercial functions, among them the provision of uniform regulations for commercial travelers, of uniform arrangements for the classification of merchandise, for customs regulations, for consular certificates and invoices, and

for port charges. It gives special consideration to the protection of patents and trade-marks and deals with the extension of arbitration for adjusting commercial disputes. It is a useful and dignified body, whose work touches closely that of the Department of Commerce. It is in no respect inharmonious, but it is separate. The Department of Commerce has no legal relation to it. A list of its publications is found upon page 59 of the Hearings Before the Committee on Foreign Affairs, House of Representatives, Sixty-fifth Congress, third session, on the diplomatic and consular service appropriation bill, under date of December 11, 1918.

The Railroad Administration, through its power to embargo freights, to grant or remove export rates, may at times exercise a controlling power over both our domestic and foreign commerce; but it has under the law no relation to the Department of Commerce and, save as a matter of courtesy, does not assume that there is any joint field of endeavor.

The Department of State, for reasons admitted by all to be good and sufficient, maintains foreign-trade advisers and a force for the purpose of gathering foreign-trade information. The relation between that department, especially through its Consular Service and the foreign-trade advisers and the Department of Commerce, is intimate and cordial. It has been a privilege to express admiration for the fine and fruitful work of the Consular Service. There is a "no man's land" wherein the diplomatic field runs parallel with the commercial and the commercial field touches closely upon the diplomatic. It will probably always be necessary to maintain a species of joint endeavor between the two departments.

The Department of Agriculture, through several services, assists or supervises large commercial transactions at home and abroad, and does so ably and with advantage to the country.

Again, let it be emphasized that the relations between these various bodies are not frictional, but cordial. The men comprising the various groups are friends. They realize they are working to a common end. I repeat, the question is not one of individuals, but one of organization. There can be no clear-cut commercial policy carried out by separate bodies in the commercial field that do not interfunction. Any industrial organization composed as is the commercial organization of the Government would fail, for the seeds of decay are planted in the very separateness of the component parts. It is not urged that these bodies should cease to be or that their functions should be altered.

There are separate duties belonging to each, although many of those duties lie in a common field with the Department of Commerce.

It is, however, strongly urged that each and every one of these separate services should be linked formally to that Department which alone the law charges with the duty to "foster, promote, and develop the foreign and domestic commerce" of the country.

Is there sound reason why there should not be a representative of the Department of Commerce upon the War Finance Corporation, upon the Federal Reserve Board, upon the Federal Trade Commission, upon the Shipping Board, upon the Interstate Commerce Commission, or upon the Railroad Administration? If such reason exists, what is it? On the other hand, is it the public purpose and intent that the Department charged to "foster, promote, and develop the foreign and domestic commerce" of the country should do it only in part, subject to the kindly and unintentional, but nevertheless real, competition and control of others charged with different duties, indeed, but so acting as in some measure to perform or to control the performance of this work?

Very clearly either the Department of Commerce should be so organized as to perform its important function effectively or it should not. If it should not do so, then the organic law dictating its functions should be modified, and it should cease to be in name what it is hardly in fact, the Department of Commerce. Or, on the other hand, it should be recognized that it is really the center of commercial organization on the part of the Government, and as such these various independent bodies should so be headed up into it that the world of commerce and the business man may know there is one head for commerce as there is one for agriculture, as there is one for war, as there is one for the Navy, and not a congeries of unrelated parts which operate, indeed, in personal harmony and peace, but without those effective results which alone can come from systematic and unified effort.

The foregoing report is respectfully commended to your attention and to that of Congress.

Respectfully,

WILLIAM C. REDFIELD,
Secretary.

REPORT OF THE SECRETARY OF LABOR.

DEPARTMENT OF LABOR,
OFFICE OF THE SECRETARY,
Washington, D. C., November 10, 1919.

To the PRESIDENT:

The great world conflict was only in a very superficial sense a contest between armed men. In a deeper sense it was a conflict between organized peoples. Victory was determined by the superior ability of the peoples of the allied and associated nations to keep their troops in the field properly supplied and equipped with the necessary materials and munitions of war.

He would be ungrateful indeed who did not recognize that the chief burden of the war was borne by those who risked their lives. But it detracts nothing from their share in the victory to realize that the forces of the world democracies would have been helpless had they not had behind them united peoples and effective industrial forces. Back of the armed men were ships which sped across the ocean with the products of American labor, and railroads which transported those products to the seaboard; behind the railroads in turn were warehouses, workshops, factories, and mines. All these are in the long run but different forms of labor; and had any of this labor faltered we should not now be preparing to enjoy the blessings of peace and liberty.

There have been some speculation and some unfortunate disputes as to the nation which contributed in greatest part toward the winning of the war. Such discussions are futile. But it is of the highest importance that we realize that the thing which did make victory possible was labor. The efficiency of our Nation in war was determined—as was the efficiency of all other nations—by our ability to direct our labor, whether manual or managerial, most efficiently toward a common end. And that I conceive to be one of the chief merits of democracy—that under it men can most readily cooperate toward a common end, whether in war or peace.

The importance of labor was no more a fact during the war than it had been during peace. But the exigencies of that conflict stripped

away many of the confusions of thought which had theretofore concealed the central truth that man does not live either upon the stored-up wealth of the past or by discounting the future but by his present labor.

Because war had accentuated this truth, which is as old as man, we devoted much governmental effort toward the affairs of our wage earners in war that we should have devoted before in peace. The war, therefore, resulted in a gigantic expansion of the functions of the Department of Labor. With the coming of peace many of these were discontinued, some properly so, because they were purely war functions. It is a matter of regret, however, that others were abandoned, for they are as needful in peace as in war. It is a matter of regret in particular that two agencies which were of special importance have had to be practically abandoned. Although the organic act of the Department of Labor specifically charges the Department with improving the working conditions of wage earners and advancing their opportunities for profitable employment, two services of the Department devoted to the first object—the Working Conditions Service and the United States Training Service—have been of necessity abandoned, while the one devoted to the latter object—the United States Employment Service—has been forced to curtail its work.

INTERNATIONAL LABOR CONFERENCE.

In world-wide interest and historical significance the most important phase of the work of this Department since its last report relates to the first meeting of the General Conference of Representatives of the Members of the League of Nations for labor adjustments held pursuant to those provisions of the treaty of peace with Germany which are comprised in Part XIII. This meeting convened at Washington October 29, 1919. In order to report upon the activities of the Department of Labor with reference to this meeting, as well as for further reasons, I am extending my annual report beyond its fiscal year and as nearly as possible up to the date of transmission.

Part XIII of the treaty of peace with Germany, which includes all the articles thereof between article 386 and article 428, establishes a permanent international organization of labor on the basis of social justice. Its method is the promotion of what it characterizes as an urgently required improvement of those existing conditions of labor which involve such injustice, hardship, and privation to large numbers of people as to produce unrest so great that the peace and harmony of the world are imperiled. Specific suggestions by the treaty for this improvement include recognition of the principle of freedom of association; regulation of working time and labor supply; prevention of unemployment; provision for an adequate living wage;

protection of workers against sickness, disease, and injury arising out of employment; protection of children, young persons, and women; provision for old age and injury; protection of workers when employed in countries other than their own; and organization of vocational and technical education.

The permanent international organization so established consists of a General Conference of Representatives of the Members of the League of Nations, together with an International Labor Office to be controlled by a Governing Body and to be located at the seat of the League of Nations as part of the league. The general conference is composed of four representatives of each member of the League of Nations. Two of these representatives are Government delegates: the other two respectively represent employers and workers and are chosen by each Government in agreement with the industrial organizations most representative of employers or of working people, as the case may be, in their respective countries. The Governing Body consists of 12 persons representing Governments, 6 representing employers, and 6 representing wage earners. The Director of the International Labor Office, who chooses his own staff, is appointed by the Governing Body and is subject to its instructions. Disputes among members are appealable to the Permanent Court of International Justice provided for in article 14 of the treaty, which is part of the covenant of the League of Nations.

The first meeting of the general conference is provided for by Chapter IV and its Annex in Part XIII of the treaty. This chapter, entitled "Transitory provisions," is devoted, together with its annex, to the first meeting of the general conference. Therein the treaty requires the first meeting of the conference to take place in the month of October, 1919, at Washington. It is also therein required that arrangements for the convening and the organization of such first meeting should be made by the Government of the United States, and to this end our Government was therein and thereby requested to convene the same.

Subsequently, by joint resolution, Congress adopted the following authorization, which was approved August 15, 1919:

That the President of the United States be, and he hereby is, authorized to convene and to make arrangements for the organization of a general international labor conference to be held in Washington, D. C.: *Provided, however,* That nothing herein shall be held to authorize the President to appoint any delegate to represent the United States of America at such conference or to authorize the United States of America to participate therein unless and until the Senate shall have ratified the provisions of the proposed treaty of peace with Germany with reference to a general international labor conference.

By authority of the aforesaid resolution the Department of State sent an invitation, through the American embassies and missions

abroad, to the countries named in the annex to the League of Nations covenant. The invitation was in the following terms:

The President of the United States, in accordance with the provisions of Part XIII of the treaty of peace between the allied and associated powers and Germany signed at Versailles on June 28, 1919, and under authority vested in him by Congress, hereby convenes the first meeting of the annual labor conference therein described to assemble in Washington at noon on the 29th day of October, 1919.

The Government of the United States extends to each nation which is or which prior to the said meeting shall become a member of the international labor organization as defined in article 387 an invitation to send its delegates and other representatives to Washington for the purpose of attending such conference.

Meanwhile, by oral direction of the President, the Department of Labor had undertaken informally the administrative details of the work to be done by the United States in making arrangements for the convening and the organization of the first meeting of the general conference described above. By order thereupon made by the Secretary of Labor, of date July 24, 1919, Nathan A. Smyth (alternate to Samuel Gompers on the International Organizing Committee for the International Labor Conference) was appointed Assistant to the Secretary of Labor to act for the Department of Labor in working out the details hereunder outlined; and by subsequent order of the Secretary, E. H. Greenwood was appointed to assist and represent Mr. Smyth. The details so intrusted to Mr. Smyth and Mr. Greenwood were as follows:

1. Preparation, in connection with the State Department, in readiness for transmission so soon as the President may deem it possible, of—

- (a) The call convening the conference.

- (b) The invitation to the International Organizing Committee to meet in this country.

2. Consideration and preparation of such legislation, if any, as may be necessary—

- (a) To authorize the President to invite the labor conference to meet in this country.

- (b) To authorize the President to invite the International Organizing Committee to meet in this country.

- (c) To provide funds.

- (d) To authorize the President to appoint delegates.

3. Preparation of a plan of organization to be put into effect as soon as action is authorized covering—

- (a) The organization of necessary committees on arrangements, reception, etc.

- (b) The securing of space in buildings, translators, stenographers, printing, etc.

4. Suggesting to departments and bureaus of the Government concerned and to such organizations as the American Federation of Labor, manufacturers' associations, etc., the compilation of data concerning the agenda for the next meeting, for the use of our delegates when appointed.

5. Such other details as may be found necessary.

All preliminary details having been attended to in anticipation of the first meeting of this general conference, the Secretary of Labor, under date of October 11, 1919, made the following announcement through the Secretary of State:

In view of the uncertainty as to just when the peace treaty will become effective and as to how many nations, if any, will be members of the League of Nations by October 29, the date set for the convening of the International Labor Conference, I beg to announce that the following policy has been determined upon:

1. The Secretary of Labor, in accordance with the call issued by the President, will open the conference at the time specified in the call and receive the credentials of the delegates if any are there presented.

2. If, at the date of the opening of the conference, the treaty has become effective through ratification by the requisite number of powers and a League of Nations is in existence and properly authorized representatives of any members of such league are present at the time of the opening of the conference, the Secretary of Labor will proceed to call such conference to order and to organize it. It will then be within the province and power of the duly qualified representatives then and there present to take such adjournment, if any, as they may deem wise in order that, before proceeding with the agenda, a more complete membership of the league may be secured.

3. If the treaty has not become effective by October 29, or if it has no qualified representatives of members present, the Government of the United States will adjourn further steps in the organization of the conference until a date when it may be expected that sufficient duly qualified representatives of members can be present so that the organization of the conference may be perfected.

The foregoing policy is based upon the following considerations:

There is no provision in the treaty under the authority of which any Government, or any body of representatives of any Government, can postpone the conference or authorize its convocation other than in the month of October. If the conference is not convened in October it can not be convened at all without an amendment to the treaty.

Under the treaty, the conference has complete power to determine its own mode of procedure. If, therefore, there are any duly qualified members of the conference present when it is convened they have unquestionable authority to provide for such adjournment as they may deem advisable. Under ordinary parliamentary procedure less than a quorum may adjourn a meeting from time to time until a quorum is present.

Under the treaty the Government of the United States is given authority not only to make arrangements for convening but also for the organization of the conference. The conference has been duly called for a date within the month of October. The power to organize the conference impliedly and necessarily carries with it the power to hold the conference open until such later date as it may be possible to fully organize it. While the power to convene ends with the convocation of the conference, which must under the treaty take place in October, the power to organize is a continuing power which is not specifically limited in the treaty and necessarily must last on until such time as the conference is sufficiently organized with qualified members to be able to take over the direction of its own procedure.

The general conference convened in its first meeting on Wednesday, October 29, 1919, in the conference room of the Pan American Union at Washington. There were representatives present from 32 nations.

The following persons were chosen as the permanent officers of the conference: President, William B. Wilson, Secretary of Labor of the United States; secretary general, Harold B. Butler, secretary of the British ministry of labor; deputy secretaries general, Dr. G. Pardo, of the Italian ministry of labor, and Mr. Ernest H. Greenwood, of the United States Department of Labor.

The conference then proceeded to discuss the admission of certain other States which had made application for admission and of certain

others which had been proposed. Of these, Germany and Austria were admitted at once, there being but a single dissenting vote. With respect to Finland, however, much controversy arose, with the final result that the conference took the view that its power to admit Finland was debatable. It therefore merely invited the delegates of that country to take part in the conference on the same conditions as obtained in the case of other countries which had not adhered to the covenant. With respect to Mexico, Luxemburg, and the Dominican Republic no action was taken, nor was there any ruling with respect to their admissibility, it being felt that since no formal application had been made by any of those three countries, no action taken by the conference looking toward their admission would be proper under the circumstances.

The conference then undertook discussion of the five subjects set forth in the agenda as specified in the treaty of peace with Germany. Those subjects are as follows:

1. Application of principle of the 8-hour day or of the 48-hour week.
2. Question of preventing or providing against unemployment.
3. Women's employment:
 - (a) Before and after childbirth, including the question of maternity benefit.
 - (b) During the night;
 - (c) In unhealthful processes.
4. Employment of children:
 - (a) Minimum age of employment;
 - (b) During the night;
 - (c) In unhealthful processes.
5. Extension and application of the international conventions adopted at Berne in 1906 on the prohibition of night work for women employed in industry and the prohibition of the use of white phosphorus in the manufacture of matches.

At the date of this report the conference was still in session.

THE NATIONAL INDUSTRIAL CONFERENCE.

Second only in potential importance to the International Labor Conference, and far transcending it in potential consequence to our important domestic affairs, was the National Industrial Conference. During the war industrial peace had been maintained by a patriotic spirit on the part of both employers and wage earners which made them more willing than they would ordinarily have been to sink all except their most pressing disagreements in order that we might present a united front against the common enemy. Many of their agreements ran only for the term of the war. The greater part of them, if not actually terminated in fact by the armistice, were at least terminated in spirit. The truces which had been declared during the war were recognized on all sides as provisional. Workmen who had long exercised the right to organize and strike, and employers who had long exercised contracting privileges, did not consider themselves as having permanently abandoned their powers in those

respects. On the other hand the general feeling was that they still possessed those powers in the fullest measure, but that temporarily the public necessity had superseded a purely private prerogative.

The fact that war arrangements were considered as provisional rendered it all the more imperative that some permanent understanding be arrived at by which a new basis for the future conduct of industry might be reached. Many disputes were no less bitter for having been suppressed and many a smoldering fire was but awaiting the critical moment to burst into flame. This situation was rendered all the more acute at the close of the fiscal year by the discontinuance of the National War Labor Board, to which during the war had been referred all those disputes which it had been found impossible to adjust by mediation or conciliation. Coupled with these considerations was the fact that the repression of grievances had created a nervous tension which strained former good relations to the breaking point. In addition, our own country, although our basic conditions were sound, suffered from the reflex of a disorganized Europe. The activities of war which had taken the place of normal industry and commerce had been abandoned and the peaceful channels of trade had not yet been reestablished. In view of this it was imperative that in the work of reconstruction a genuine spirit of friendliness and cooperation between the workers and employers of the United States be established.

A call was therefore issued by the President on September 3, 1919, for a National Industrial Conference, to be participated in by conferees who fell in general within three classes—those representing the employers of the Nation, those representing the wage earners, and a third group who should represent the public itself and assist the other two groups in arriving at a common viewpoint. Accordingly, letters were directed by the President to the principal organizations of employers and wage earners of the United States asking them to name delegates in equal numbers. This was a relatively simple proceeding so far as wage earners were concerned, for practically all the organized workers in the United States are banded together within the American Federation of Labor. The president of that organization, Mr. Samuel Gompers, was, therefore, requested to name the fifteen delegates. With regard to employers the situation was more difficult, for there is no single outstanding organization which includes all organized employers in the same sense that the American Federation of Labor includes all organized working people. The choice of the representative of employers was consequently left to the directing heads of several business organizations. Letters were addressed to Mr. Magnus W. Alexander, managing director of the National Industrial Conference Board, requesting that he name five representatives; to Mr. William G. Baker, jr., president of the Invest-

ment Bankers' Association, requesting that he name two; and to Mr. Homer L. Ferguson, president of the Chamber of Commerce of the United States of America, requesting that he name five. In addition, representation was granted to the employing farmers through the naming of one delegate each by Mr. Oliver Wilson, president of the National Grange, Mr. C. S. Barrett, president of the National Farmers' Union, and Mr. J. N. Tittimore, president of the American Society of Equity. The following letter, addressed by the President to Mr. Gompers, sets forth the purpose of the meeting. It is a replica of those sent to the other persons named:

For the purpose of reaching, if possible, some common ground of agreement and action with regard to the future conduct of industry, I desire to obtain the combined judgment of representative employers, representative employees, and representatives of the general public conversant with these matters, and for the accomplishment of that purpose I have decided to call a conference of five persons to be selected by the Chamber of Commerce of the United States of America, five persons to be selected by the National Industrial Conference Board, fifteen persons to be selected by the American Federation of Labor, three persons to be selected by the farming organizations, and two persons to be selected by the investment bankers, to confer with fifteen representatives of the general public whom I shall select, these representatives to meet in the City of Washington on October 6, 1919, for the purpose of consulting together on the great and vital questions affecting our industrial life and their consequent effect upon all our people, to discuss such methods as have already been tried out of bringing capital and labor into close cooperation, and to canvass every relevant feature of the present industrial situation, for the purpose of enabling us to work out, if possible, in a genuine spirit of cooperation a practicable method of association based upon a real community of interest which will redound to the welfare of all our people.

The wastages of war have seriously interfered with the natural course of our industrial and economic development. The nervous tension of our people has not yet relaxed to normal. The necessity of devising at once methods by which we can speedily recover from this condition and obviate the wastefulness caused by the continued interruption of many of our important industrial enterprises by strikes and lockouts emphasizes the need for a meeting of minds in a conference such as I have suggested. I am sure that your organization will gladly bear the expense of its own representatives to a conference called for such an important purpose, and I would therefore request that you select fifteen persons to act as the representatives of the American Federation of Labor in the conference, and advise the Secretary of Labor of the names and addresses of the persons selected so that he may make the necessary arrangements for the meeting.

Subsequently two persons were added to the employers group to represent railroad management, four were added to the representatives of labor to represent the four railroad brotherhoods, and a number of additional persons were added to represent the public.

By direction of the President the preliminary arrangements for the conference were carried on by the Department of Labor. The conference convened on October 6, at the Pan American Union Building in the city of Washington. The Secretary of Labor as temporary chairman, with Hon. Rowland B. Mahany as temporary secretary organized the conference, after which Hon. Franklin K. Lane (Sec-

retary of the Interior) was chosen permanent chairman and Hon. Lathrop Brown permanent secretary. The Secretary of Labor was invited to sit in the conference as an advisory member, and did so.

Rules were adopted which provided for group action. Under these rules no proposal introduced by any single delegate could be considered by the conference unless it had first received the assent of the majority of the group of which the proposer was a member. Nor could any final determination of policy or statement of a guiding principle be arrived at by the conference unless the proposal in question had received the votes of the majority in each group. Acting upon this basis, the conference proceeded to discuss many resolutions which were introduced.

From the beginning it was evident that no decision could be reached unless an understanding was had with regard to the right of collective bargaining. Originally introduced as a substitute for a resolution to mediate in the pending steel strike, this subject was almost the only one which received consideration. Finally, on October 21, all proposals then pending or submitted by any of the three groups were rejected by the conference. At this point it appeared that certain of the delegates had come to the conclusion that further discussion was futile and were upon the point of withdrawal. An adjournment was agreed upon, however, and the following morning a letter, addressed by the President to the conference, was read before the body. That letter, which urged it to continue in session, was as follows:

I am advised by your chairman that you have come to a situation which appears to threaten the life of your conference, and because of that I am presuming to address a word of very solemn appeal to you as Americans. It is not for me to assess the blame for the present condition. I do not speak in the spirit of criticism of any individual or of any group. But having called this conference I feel that my temporary indisposition should not bar the way to a frank expression of the seriousness of the position in which this country will be placed should you adjourn without having convinced the American people that you had exhausted your resourcefulness and your patience in an effort to come to some common agreement.

At a time when the nations of the world are endeavoring to find a way of avoiding international war, are we to confess that there is no method to be found for carrying on industry except in the spirit and with the very method of war? Must suspicion and hatred and force rule us in civil life? Are our industrial workers to live together without faith in each other, constantly struggling for advantage over each other, doing naught but what is compelled?

My friends, this would be an intolerable outlook, a prospect unworthy of the large things done by this people in the mastering of this continent; indeed, it would be an invitation to national disaster. From such a possibility my mind turns away, for my confidence is abiding that in this land we have learned how to accept the general judgment upon matters that affect the public weal. And this is the very heart and soul of democracy.

It is my understanding that you have divided upon one portion only of a possible large program which has not fully been developed. Before a severance is affected based upon present differences, I believe you should stand together for the develop-

ment of that full program touching the many questions within the broad scope of your investigations. It was in my mind when this conference was called that you would concern yourselves with the discovery of these methods by which a measurable cooperation within industry may have been secured and if new machinery needs to be designed by which a minimum of conflict between employers and employees may reasonably be hoped for, that we should make an effort to secure its adoption. It can not be expected that at every step all parties will agree upon each proposition of method suggested. It is to be expected, however, that as a whole a plan or program can be agreed upon which will advance further the productive capacity of America through the establishment of a surer and heartier cooperation between all the elements engaged in the industry. The public expects not less than that you shall have that one end in view and stay together until the way is found leading to that end or until it is revealed that the men who work and the men who manage American industry are so set upon divergent paths that all effort at cooperation is doomed to failure.

I renew my appeal that with a full comprehension of the almost incomparable importance of your tasks to this and to other peoples, and with full faith in the high patriotism and good faith of each other, you push your task to a happy conclusion.

The labor group thereupon requested permission to withdraw temporarily for consultation. A recess was accordingly taken. Upon reconvening the conference was addressed by the chairman of the labor group, who offered the following resolution:

The right of wage earners to organize without discrimination, to bargain collectively, to be represented by representatives of their own choosing in negotiations and adjustments with employers in respect to wages, hours of labor, and relations and conditions of employment is recognized.

After discussion, which occupied two sessions, the resolution was rejected. The groups representing the public and labor, respectively, voted unanimously in its favor, but the employers group, by a divided vote, rejected it. Although an overwhelming majority of the delegates were in favor of this proposal, it was, nevertheless, not adopted, since the rules already adopted by the conference required, as stated above, a majority of each group to declare the judgment of the conference.

Following the defeat of this resolution the chairman of the labor group, speaking for that group, addressed the conference at length, announcing in concluding that in the opinion of his group nothing could be gained by remaining. Thereupon the entire group withdrew.

On the following day the conference convened with only the public group and the employers group present. The chairman of the conference, speaking for the President, announced the desire of the latter that the nature of the conference itself should be changed because of the change of conditions and that the work should be carried on by the public group alone, inasmuch as the burden of industrial quarrels falls ultimately upon the public. The wish of the President was stated by the chairman to be that the public group should continue in session as a group and make a report and give advice and suggestions as to the future industrial policy of the Nation. These proposals were to be presented to the President.

With that announcement the conference as then constituted was adjourned sine die.

The public group immediately met to canvass the possibilities. After an adjournment until the following day it met again and addressed the following communication to the President:

TO THE PRESIDENT OF THE UNITED STATES.

SIR: The delegates appointed by you as representatives of the general public in the industrial conference just closed beg to submit the following report:

The conference proper opened on October 6 and terminated on October 23, sitting in all 13 days. The public group held 23 meetings for the discussion of the various matters brought before the conference.

The public group, as was intended, differed from the other groups, representing labor and capital, in one important particular. It had not the homogeneity of interest of either of these groups; it represented rather a cross section of American life. Among its members were employers of labor, large and small, farmers, capitalists, representatives of labor, socialists, and professional students of social and industrial problems. Notwithstanding this diversity of interest and relation there was manifested throughout an astonishing amount of agreement upon the most vital subjects. This we regard as a most hopeful sign for the future and an evidence of the possibility of a united action in the interest of the entire Nation.

The existence of the steel strike had the effect of focusing interest and attention upon the present conflict as against constructive measures and agreement for the future, and made the calm discussion of such constructive measures difficult. Because it was manifestly impossible to dispose of this subject by agreement under the rules of the conference, which required concurrence of at least a majority of each of the three groups, the conference decided to defer action upon the question until the subject of collective bargaining had been passed upon.

After several days of earnest endeavor and numerous attempts at adjustment between the points of view of the several groups the conference failed to agree upon this issue.

In this connection we deem it important to emphasize the fact that the conference did not, at any time, reject the principle of the right of workers to organize and to bargain collectively with their employers. Neither the conference as a whole nor any one group in the conference opposed that right. The difficulty that arose and the issue upon which the conference failed to agree was not upon the principle involved but upon the method of making it effective.

In our judgment even this difficulty would not have been insurmountable had the conference approached its task in another way.

Obviously, the important principle of collective bargaining can not be sharply separated from other elements in the great problem of the relation of employers and employed. The right of organization, the protection, in the exercise of their lawful rights, of those who seek to organize the workers; the careful definition of the various forms of organization through which the right may be exercised; and the machinery necessary for adjusting disputes arising in connection with that right—must all be taken into account in their proper relation.

We believe that the experience of this conference, and of similar conferences elsewhere, clearly shows the futility of attempting to deal with this great question in a piecemeal way, by adopting detached and unrelated resolutions. The only efficient method, in our judgment, is that of formulating a comprehensive and systematically developed program.

We believe that the right of workers to organize for the purpose of collectively bargaining with their employers, through representatives of their own choosing, can not

be denied or assailed. As representatives of the public we can interpret this right only in the sense that wage earners must be free to choose what organizations or associations, if any, they will join for this purpose.

In the recognition of the right of workers so organized to be represented by representatives of their own choice difficulties will from time to time arise. We believe that it would be possible for a properly constituted arbitral authority to adjust such difficulties with justice and fairness to all parties concerned.

The abrupt termination of the conference prevented any discussion in the conference of the important matter of the right of workers to strike and of the methods whereby, without destroying or impairing that right, the public interest may be adequately conserved and protected.

We are deeply impressed by the necessity of setting up some machinery for effecting the speedy adjustment of disputes arising between workers and employers, whether the latter be private individuals or firms, or public and governmental authorities. In this connection there was submitted to the conference by the Secretary of Labor, Hon. W. B. Wilson, a well-considered plan for establishing the necessary machinery for conciliation and arbitration. Because this plan was not considered by the conference, owing to the manner of its termination, we do not here express any judgment upon it further than to say that we believe it affords a possible basis for a solution of the immediate problem and deserves serious consideration and study.

It is impossible to discuss in detail the numerous schemes for affording to workers representation in the regulation of the conditions of labor, the plans for profit sharing, the many forms of shop councils, and the like. We respectfully suggest that a very great service could be rendered to the Nation, to employers and employees alike, if in the Department of Labor there were established a bureau for the purpose of gathering and making available accurate information concerning all such experiments and their results. Such a bureau could give expert advice and assistance to any persons desiring to undertake plans for bettering labor conditions in particular establishments.

As representatives of the general public we are of the opinion that the standards relating to the employment of women and children advocated by the Woman's Division and the Children's Bureau of the United States Department of Labor should be favorably considered.

We do not believe that this group can at this time with advantage further proceed with the discussion of the great questions with which we have been dealing. It may well be, however, that a small committee, selected by you, composed of persons of varied interests and points of approach, could take up the matter and prepare along some such lines as herein indicated a program which will be of present value. Upon the presentation of the report of such a committee steps could be taken to give it practical effect through another conference representing capital, labor, and the public, if in the circumstances then existing it should seem to you to be wise.

In closing this report and terminating our labors, we desire to give expression to our conviction that the conference has been of very real educational value to all those privileged to participate in it. The frank and sincere interchange of opinions, views, and experiences, both within the groups and between them through individual contact, has given, we believe, to every member of the conference a broader vision and understanding and helped each to see the problems of the other.

Assuring you of our profound respect, and solicitude for your recovery, we have the honor to be,

Very truly, yours,

THE GROUP REPRESENTING THE PUBLIC.
BERNARD M. BARUCH, *Chairman*.

OCTOBER 24, 1919.

After thus presenting their views, the public group adjourned sine die, thus bringing all the conference proceedings to an end.

OFFICE OF THE SECRETARY.**THE DIVISION OF CONCILIATION.**

With the close of the last fiscal year seven cases were carried over into the present year, nearly all of which had just been brought to the attention of the department. All these were speedily settled, with one exception.

The war-time machinery of many of the governmental agencies continued to function until a few weeks after the signing of the armistice, November 11, but it was soon evident that, although legally our Nation was still in a state of war, both employers and employees, nevertheless, considered the war as practically at an end. It soon became more difficult to handle the disputes which arose than during the period in which our country was actually engaged in war. This was not only our own experience, but it was the experience of governmental agencies with which the Department of Labor had worked in cooperative relations. Following the signing of the armistice and the beginning of demobilization the existing good relations between employers and wage earners were very much disturbed. This was noticeably reflected in the attitude of all persons engaged in the manufacture of war materials. During the latter part of 1917 and during 1918, harmonious relations had been agreed to by all in order that our military needs should be taken care of promptly and efficiently. A patriotic impulse had stirred both the employer and the worker and many differences that, based upon our experience in normal times, would have caused a suspension of operations were very lightly passed over and adjusted without recourse to either strikes or lockouts. So, during the period from July 1 to November 11—what may be called the war months—the Division of Conciliation encountered few difficulties in making harmonious adjustments. From November 11 until the present date, the readjustment of industry from war to peace time activities, the reemployment of demobilized soldiers, and the transfer of workers from war industries to normal production have all contributed to the general unrest so noticeable not only in our country but throughout the world.

When the armistice was signed the Division of Conciliation immediately entered into cooperation with all governmental branches interested in the various grave problems of industrial readjustment. With the termination of war emergency appropriations on June 30, 1919, many war-emergency organizations ceased to function wholly or in part. As a consequence, various branches of the Department of Labor were called upon to take over some part of their activities, and the Conciliation Division, therefore, found it necessary to do its part. The problems of readjustment were many. Methods of conciliation employed in normal times and in war times had to be changed to meet new conditions. The sudden cessation of war was followed

immediately by the cancellation of war contracts and the temporary closing down of many industries for the purpose of installing machinery and equipment for the resumption of the manufacture of the customary peace-time products. The demobilization of the Army soon followed the demobilization of our huge industrial army of workers and added to the burden through the introduction of large numbers of unemployed—always a cause of unrest. The cases handled by the department at this time presented many new and perplexing problems caused by the transition processes, and while in most instances it was more difficult to secure as speedy settlement as usual, the high general average of satisfactory adjustments was gratifying.

It must be remembered that during the entire time our country was engaged in war not a single general strike occurred in any important industry, and for months at a time there was not a serious dispute in the coal industry, the shipbuilding industry, the lumber industry, the oil industry, or on the transportation systems of the United States.

As has been stated in previous reports, the Department of Labor has no power and exercises none through this division to make decisions or awards in disputes submitted to it. It can not hand down an award and then demand that the employers and employees concerned shall abide by its decisions. The work of conciliation is more diplomatic than judicial. Conciliators act as industrial peacemakers, endeavoring to get contending parties together, so that they may more readily agree upon a solution of their own problems in their own way, suggesting methods and alternatives that have been proved, and that tend toward a peaceful adjudication of the matters in dispute. It has been the policy of the Department of Labor not to endeavor to impose its viewpoint upon either the worker or the management in any dispute that may arise, but rather to find some basis mutually acceptable, even though it may not be mutually satisfactory. It is in this spirit that all our problems of conciliation in labor controversies are approached. As a result conciliators are often able to remove the barriers which prevent employers and employees from meeting on common ground, and thus the way is paved for freer relations and a broader grasp of their respective rights and corresponding obligations. The fact is brought home to each that there is another side; and even in the absence of immediate success, the seed has been sown which bears fruit in some modification of working conditions or a greater consideration for the human rights of employees and a better understanding of the problems which have harassed employers. Labor has discovered that it has a standing before the Government whenever its demands are based on industrial and constitutional rights; employers, on the other hand, have found the Department a defender against unreasonable exaction. In a majority of the cases presented for mediation a fine spirit of cooperation was shown by both employers and employees.

The success which has attended the Department's efforts in the great majority of disputes has been most gratifying. The volume of work is shown briefly in the following table:

Month.	Workmen affected in all cases.	
	Directly.	Indirectly.
1918.		
July.....	99,616	181,915
August.....	65,596	128,843
September.....	75,172	166,700
October.....	67,503	103,205
November.....	112,307	77,827
December.....	81,931	99,758
1919.		
January.....	51,667	49,423
February.....	141,870	198,279
March.....	48,367	91,028
April.....	118,266	76,236
May.....	107,149	79,398
June.....	42,324	83,460
Total.....	1,011,968	1,336,072

Reference to the five preceding annual reports will show a steady increase in the number of cases handled, although some allowance must be made for deviation from the normal on account of the war. The growth of the Division of Conciliation of the Department of Labor is indicated in the table appended:

	Mar. 4, 1913, to June 30, 1914.	1915	1916	1917	1918	1919
Number of cases.....	33	42	227	378	1,217	1,780
Adjusted.....	28	26	178	248	865	1,223
Unable to adjust.....	5	10	22	47	71	111
Pending.....		5	21	42	7	13
Unclassified.....		1	6	41	66	a 214
National War Labor Board.....					208	219

a In 64 of the cases reported as unclassified in the table, commissioners of conciliation found upon arrival that the disputes were in satisfactory process of adjustment without departmental aid; in 37, conciliators' services were no longer necessary by reason of the fact that strikers had secured employment elsewhere and did not care to resume relations with their former employers; 32 cases were terminated through the closing of plants by employers either for repairs or because of retirement from business; in 32 cases satisfactory settlements had been reached prior to the arrival of the conciliators assigned; in 59 cases adjustments were reached but are not credited to the Department because its commissioners of conciliation acted in conjunction with representatives of State boards, local committees, or local municipal officials.

California oil settlement.—Through the efforts of Hon. Verner Z. Reed (since deceased), a member of the President's Mediation Commission, an agreement was reached as a war measure in November, 1917, which established an eight-hour day and \$4 minimum wage throughout the industry in the State of California, and set up a Government body known as the Federal Oil Inspection Board to interpret the terms of this agreement and adjudicate future labor disagreements. This was accomplished without a cessation of work in the industry.

The members of the Federal Oil Inspection Board tendered their resignations to the Secretary of Labor on May 12, 1919, and the services of the board terminated. A demand by the oil workers for increased wages and changed working conditions and the resignation of the Federal Oil Inspection Board made it advisable for the President's Mediation Commission to proceed to California in July, 1919, for the purpose of adjudicating the claims of the men, setting up new machinery for the settlement of future disputes, and negotiating, if possible, a new agreement which should cover peace-time conditions.

Hugh L. Kerwin, Assistant to the Secretary of Labor, and Col. J. L. Spangler, and E. P. Marsh, members of the President's Mediation Commission, proceeded to California and conducted negotiations which resulted in a new agreement in the industry, directly affecting 15,000 workmen, to be in force until June 30, 1920. With the exception of the Standard Oil Co., all the larger producing and refining companies and many of the smaller ones participated in the conferences which brought about an agreement. The agreement provides for a minimum wage for semiskilled workers of \$5 a day, a horizontal increase of 75 cents a day per man dating from July 1, 1919, retroactive pay from January 1, 1919, of 50 cents a day per man, a union nondiscrimination clause, and a provision that within 60 days of the termination of this agreement both sides should be called into conference by the President's Mediation Commission or by the Secretary of Labor for the purpose of negotiating a new agreement.

Hon. Hywel Davies, of the Department of Labor, was named as labor adjuster to interpret and administer the terms of the agreement. The following clause in the agreement is worthy of mention:

The duties of the adjuster shall be to familiarize himself with operating conditions and from time to time make representations to the operators or to the men as to any matter which he deems should be changed for the welfare of the industry as a whole.

It is a source of particular gratification to the Department of Labor that from the date that Hon. Verner Z. Reed first intervened up to the time of the renewal of the agreement just described there has been no cessation of work in this industry in California due to labor controversy.

The New York Harbor situation.—Of predominating influence in overseas shipping in normal times, the port of New York during the war was of an importance that can not be overestimated. Through it passed the bulk of our men and supplies. Any interruption to shipping activities at the port would have meant immediate congestion and would have cut the main line of communication with the allied front. As stated in the Secretary's annual report for 1918, the Department of Labor has been actively in touch with labor conditions in the port since the early part of 1917, when a threatened strike of harbor employees led to the assignment of Mr. James L. Hughes as

commissioner of conciliation to endeavor to bring about a settlement of the dispute. Subsequently a board of arbitration was set up, composed of a representative each of the Shipping Board and the Departments of Labor and Commerce. Mr. Ethelbert Stewart was designated to represent the Department of Labor. Mr. Benjamin M. Squires, commissioner of conciliation for the Department, was detailed as administrator, and later, upon the resignation of Mr. Stewart, served also as a member of the board, and finally as chairman.

No interruption to harbor traffic occurred during the period of hostilities, though more than a thousand complaints were handled, any one of which if not dealt with promptly might have precipitated a strike. After the signing of the armistice employing interests in the harbor took the position that they were no longer bound by their agreement to arbitrate "during the period of the war" and refused to be bound by any award that might be made by the board of arbitration. Reference to the War Labor Board was also refused. The result was a three days' strike in January, 1919, terminated only by a cabled request from the President that the War Labor Board hear and determine the case and by direct appeal from the Secretary of Labor that the men return to work. Following the award of the War Labor Board another strike occurred, completely paralyzing shipping at the port. In the absence of Mr. Squires, Commissioner Hughes was again detailed to assist in adjusting the dispute and succeeded in bringing about a settlement in the case of employees on Government-operated craft. Private employers stood out, however, and a settlement was not reached until the men had been out seven weeks. Then by intercession of the mayor, the Secretary of Labor, and other Government officials a permanent board of arbitration was created by employers and employees.

The Department was also a party to the agreement creating the National Adjustment Commission for the adjustment of wages and working conditions of men engaged in loading and unloading vessels. The record of this commission is as enviable as that of the New York Harbor Board in that no stoppage of work occurred during the period of actual hostilities. The commission was reorganized in September, 1919, on a peace-time basis through agreement entered into by the International Longshoremen's Association, steamship lines, and contracting stevedores, and the United States Shipping Board. Advisory representation on the commission was given to the Department of Labor, and Mr. Squires has been designated to represent the Department in an advisory capacity on the commission. By request of the commission Mr. Squires has served as executive secretary since January, 1919.

The only serious strike of longshoremen on the Atlantic and Gulf coasts since the commission was created occurred at New York,

October 6, 1919. On that date the commission made an award granting only a slight increase in wages and referring to the President's proclamation calling for a truce in wage conflicts. The entire port was tied up for a period of 10 days. Every effort was made to secure compliance with the agreement to accept the award of the commission. The American Federation of Labor called upon the longshoremen to abide by their agreement.

The matter of accepting the award was submitted to a vote of the locals of longshoremen and the strike was called off.

Jurisdictional disputes in building trades.—The building trades department of the American Federation of Labor requested the assistance of the Department in an effort to find some solution of numerous jurisdictional contentions existing in the building trades. Secretary Wilson requested Commissioner John B. Lennon to endeavor to work out a solution of the difficulties. Through Secretary Spencer and President Donlin, of the building trades department, the first conference was held in the State of New York, where the matter in a general way was discussed by the officers of the building trades and representatives of the employers' associations interested in construction work. This meeting was adjourned to a future date, when another conference was to be held in Boston. This conference was held, and a general discussion was had as to the possibility of formulating a plan for the elimination of jurisdictional disputes in the building industry of the United States. No formal work was done on the plan at the Boston meeting.

The next meeting was held in the city of Chicago, at which time a plan submitted by Commissioner Lennon was given consideration. Some changes were discussed and a few approved, and he was requested to have it formulated and submitted to the next meeting of the same representatives who had met in Boston.

The fourth and last meeting was held at Indianapolis, Ind., at which time the following representatives were in attendance, representing the organizations named: John B. Lennon, representing the Department of Labor; E. J. Russell, Walter Kilhan, and W. G. Luce, representing the American Institute of Architects; A. R. McCreary, representing Associated General Contractors of America; E. W. Reaugh, representing National Association of Builders Exchanges; John H. Donlin, William J. Spencer, William Dobson, J. J. Hynes, and John Cosgrove, representing the building trades department of the American Federation of Labor.

At this conference a plan was unanimously adopted. The conferees were by their instructions from the organizations they represented compelled to submit the matter to their various organizations for ratification. This was done and the plan was approved by all the organizations, and at the next meeting of the executive board of the building trades department the matter will be considered and un-

questionably immediate steps will be taken to put it into force and effect. During the period the commissioner was assigned to the work he visited and interviewed persons interested in the general subject in the cities of Chicago, New York, Buffalo, Kansas City, St. Louis, and several other places, and found the sentiment everywhere decidedly favorable to making the attempt to eliminate these unfortunate disputes which so often cause a stoppage of construction work. It is believed that the plan, if adopted and put into effect, will prove wholly successful. The Department was greatly assisted in bringing about this desired result by President Donlin and Secretary Spencer, of the building trades department, and also by Messrs. E. J. Russell and W. G. Luce.

Textile strikes, Lowell, Mass., and Manchester, N. H.—The Massachusetts State Board of Arbitration advised the Department of serious textile controversies in northern Massachusetts and New Hampshire which threatened to culminate in strikes on Monday, July 1, 1918. The magnitude of these controversies, which involved upward of 50,000 workers engaged largely in producing materials for the Army and Navy, was such that an early termination of the difficulties was absolutely essential. Commissioner H. J. Skeffington, of Boston, Mass., was delegated by the Secretary of Labor to conduct the negotiations. The demand of the employees was for a general increase of 15 per cent in wages. The companies met this demand with an offer of 10 per cent, and agreed to leave the matter of the additional increase of 5 per cent to the National War Labor Board for arbitration. The question not having been settled, the Lowell operatives went out on strike on July 1, to be followed shortly afterward by the Manchester workers. The Lowell mill agents appealed to the War Labor Board and the board responded by sending two examiners to Lowell to investigate the situation. Upon learning that the matter was in the hands of a representative of the Division of Conciliation, they held the proposed investigation in abeyance. Mr. John Golden, president of the United Textile Workers of America, conducted the negotiation for the employees. The question of referring the dispute to Mr. H. B. Endicott, chairman of the Massachusetts Public Safety Committee, was proposed and was finally accepted by Mr. Golden on behalf of the employees. The mill agents acquiesced in this arrangement, and the strike was declared off. Mr. Endicott rendered a prompt decision in the matter, granting the original 15 per cent increase demanded by the operatives. The Manchester strike was adjusted by granting the demands of the strikers in their entirety, the award to be retroactive to June 17, 1918. It was further agreed that, in order to insure continuity of production to the capacity of the mills throughout the war, any future question or issue arising should be referred to the National War Labor Board for adjudication.

Bridge shops, St. Louis, Mo.—A controversy having arisen in the bridge shops of St. Louis, Mo., and vicinity, the good offices of the Department were requested on April 9 by Mr. D. M. Gayton, representing the employees. Thirty shops with a personnel of about 7,000 men were involved in the controversy. Commissioners F. J. Rohde and James J. Barrett were assigned by the Department. Prior to the arrival of the conciliators, the companies had refused to meet any labor representatives, stating that there was nothing to discuss. This action had been the cause of a bitter feeling between the contending parties. Eleven of the companies involved were members of the Iron Workers and Erectors' League Association. The members of the league refused to admit any present or impending controversy, stating that their employees were happy and contented. These concerns not only declined the good offices of the Department but went so far as to refuse to meet committees of their own employees. A conference was arranged, however, of all shops not affiliated with the association, and a scale of wages was finally drawn up and approved. The following is the scale as agreed upon:

	Cents per hour.
Skilled mechanics.....	56½
Semiskilled mechanics.....	50
Helpers.....	40

While the agreement secured was not altogether satisfactory to either side, it secured a temporary adjustment and allowed the strikers to resume work. The extreme bitterness shown by the employers in this case was due to the action of the union in placing the employers' association on the unfair list some two years prior to the outbreak of the strike. The temporary adjustment of the strike, however, gives rise to the hope that this bitterness of feeling may eventually die out and that pleasant relations may again be resumed.

Magnolia Petroleum Co., Beaumont, Tex.—Federal Labor Union 15338, Beaumont, Tex., notified the Department on July 24, 1918, of a serious controversy which had arisen between the Magnolia Petroleum Co. and its employees at Beaumont, Tex., and the assignment of a conciliator was requested with a view to bringing about an adjustment. Commissioner Joseph S. Myers was named. About 250 boiler makers and 1,000 other craftsmen were found to be on strike. After a number of protracted conferences had been held, an agreement was reached which was satisfactory to all but the boiler makers, and the strike was declared at an end. The boiler makers, however, remained on strike. The issue between the boiler makers and the company was that of collective bargaining, the policy of the company having been to treat with its employees individually. The company finally agreed to meet committees of its own employees, and an election was held to designate members

to act upon these committees. This had the effect of satisfying the men, the strike was declared off, and a much better feeling engendered.

McEwen Manufacturing Co., Tulsa, Okla.—On May 5, 1919, the Department received a telegram from Edward Tegtmeier, vice president of the International Brotherhood of Blacksmiths, advising of a strike of blacksmiths and machinists at the plant of the McEwen Manufacturing Co., at Tulsa, Okla., and requesting the good offices of the Conciliation Service in making an adjustment.

Commissioner Robert M. McWade, who was then at Tulsa, was assigned to take up the matter. The trouble at this plant was caused by a demand of the management that each employee sign a document agreeing that in the event he spoiled the work upon which he was engaged he should lose the time spent on that job, the company standing the loss of material. All the employees who refused to sign were advised to get their pay and leave the plant. This brought about a strike of all craftsmen engaged at the works with the exception of a few laborers.

Commissioner McWade conferred with Mr. J. H. McEwen, president and largest stockholder of the company, and prevailed upon him to compromise the difficulties. A "gentlemen's agreement" was drawn up which provided for an open shop, with a proviso that there should be no discrimination against union employees. An eight-hour day was also granted with an understanding that there should be no strikes or lockouts, and such questions as wages, working hours, etc., to be referred to Commissioner McWade and President McEwen for adjustment. This arrangement was satisfactory to the employees, who agreed to resume work at once. Two hundred and twenty-five men were directly or indirectly affected.

Mooresville Cotton Mills, Mooresville N. C.—The discharge of 300 union employees by the Mooresville Cotton Mills of Mooresville, N. C., was reported to the Department on April 6. It was intimated that these textile workers were discharged because they had recently joined a labor union and affiliated with the American Federation of Labor.

Commissioner Charles Bendheim was assigned to represent the Department. It appeared that the mill owners in this case had posted notices notifying their union employees that unless they severed their membership at once their dismissal would follow. In pursuance of this notice 300 employees were summarily discharged. This action by the company had aroused much excitement in the town, which was a small community and undergoing its first labor disturbance. Commissioner Bendheim arranged a conference with the officials of the company and finally persuaded them that their actions were unjustifiable, and secured a promise that the action would be reconsidered. After having the matter under consideration

for some time the company concluded that its former action had been unwise and agreed to reinstate its former employees with the understanding that they had a right to retain their membership in the union but that no coercive measures should be used to induce any workers to join the organization. This action of the company was received by the employees with manifestations of delight and the best of good feeling was engendered.

Milk drivers, Chicago, Ill.—A strike of milk drivers in Chicago, Ill., was reported to the Department on May 6, and the good offices of the Conciliation Service solicited. Commissioner Fred L. Feick was immediately assigned to the case. A deplorable feature of this strike was the threatened cutting off of the supply of milk to hospitals, infirmaries, and children's institutions, as well as the threatened interruption to the delivery of milk to invalids and children generally throughout the city. Commissioner Feick exerted his energies particularly in reference to this feature of the situation, and arrangements were soon made whereby milk would be delivered to such institutions. In the meanwhile conferences were arranged and efforts made to arrive at some solution of the difficulties. Three thousand drivers were affected, and an equal number of other employees were forced from their positions in consequence of the strike. The demands of the men were for a flat increase of \$9 per week plus certain commissions. The milk dealers' association was willing to grant an increase of \$4 per week. The price of milk in Chicago had recently been reduced from 14 to 13 cents per quart, and the dealers maintained that they could not possibly grant the demands of the men without restoring the former price. A feature of the strike was the advertising campaign carried on in the press, both sides carrying full-page advertisements explanatory of their respective positions. A joint conference of all the contending parties was finally arranged by the commissioner, both sides submitting all data in their possession. It was argued that the price of milk in Chicago was from 1 to 3 cents per quart less than the price in New York, Boston, Detroit, Cleveland, and Washington, and that the restoration of the price to 14 cents, which would allow the companies to pay the increase demanded by the strikers, would not be excessive. This view of the situation was finally accepted by the milk dealers' association, and the demands of the men were granted in their entirety. An agreement was signed which provided for an increase of approximately \$9 per week, which brought the weekly wages of these men up to about \$34. It was also agreed that eight hours should constitute a night's work and 10 hours a day's work.

Kelleys Island Lime & Transport Co. settlement.—An adjustment was effected of a three weeks' strike at the Kelleys Island Lime & Transport Co.'s operations at Marblehead and Kelleys Island, Ohio.

The financial loss to the men and company was at the rate of \$20,000 a week. The New York Central Railroad had laid off six train crews and suffered a loss of freight receipts estimated at over \$30,000 a week. The workers had recently organized and demanded a signed agreement recognizing their union, elimination of Sunday work, and a reduction from 10 hours to 9 hours for a workday, with 10 hours' pay. These demands were met by a diplomatic refusal of the company to sign any agreement or grant other concessions. The strike resulted.

The commissioner in this case, Mr. Frederick G. Davis, suggested a plan that overcame the employers' objection to a settlement. The committee representing the union had informed him that the workers were able and willing to produce as much in a 9-hour day as was previously produced in a 10-hour day. The rate per hour was 35 cents, so that a 39-cent rate was necessary for 9 hours in order to equal the previous 10 hours' pay. An hourly rate of 37 cents was established, and an additional 2 cents per hour was to be paid if the average tonnage previously produced in 10 hours is produced in 9 hours. In lieu of a signed agreement with the union, a letter was addressed to the representative of the Department of Labor, signed by John A. Kling, president of the Kelleys Island Lime & Transport Co., embodying this new wage rate for a 9-hour workday, and other provisions satisfactory to the employees. To prevent possible loss in the future by unnecessary stoppage of work, the following paragraph was included:

It is mutually agreed that in case of failure to agree upon the provisions of this agreement no stoppage of works shall take place until all agencies for mediation and conciliation have been utilized.

Rath Packing Co., Waterloo, Iowa.—In March, 1919, the employees of the Rath Packing Co., Waterloo, Iowa, requested the company to put into effect the provisions of the award handed down by Judge Samuel Alschuler in the Chicago packing-house controversies. The company refused acquiescence with these demands and this was followed by a vote to strike. Mr. John Blaha, representing the employees wired the Department for the assignment of a conciliator to assist in bringing about an adjustment of the dispute. Commissioner Patrick F. Gill was detailed to effect an adjustment if possible. A joint conference of the contending parties was arranged by Commissioner Gill and the points in dispute were discussed in detail. A proposed agreement was drawn up by the conciliator and after some discussion was finally agreed upon by both sides. This agreement provided for an eight-hour day, time and one-half for overtime, a minimum wage of 42½ cents per hour for men and 27½ cents for women. It was also agreed that any future disagreement arising should be submitted to the Department of Labor before the employees would go on strike.

On May 5 the company wired the Department that the agreement entered into with its employees had been broken and the men had struck without giving the 30 days' notice which was stipulated in the agreement. Commissioner Gill's services were again requested, but because of an assignment upon which he was then detailed it was necessary to designate another conciliator. Mr. Thomas J. Williams was therefore assigned to the case. The renewal of the controversy was occasioned by a demand for an increase in wages of 10 cents per hour. This demand being refused, the employees went out on strike. Joint conferences were arranged by the conciliator, which lasted three days. A plan for the classification of the workers in the packing plant was agreed to by the joint conference, and the company agreed to pay the average rates paid by the six packing companies in the vicinity of Waterloo and also pay a bonus of \$2 to all the employees. This proposal necessitated a special meeting of the entire organization of the workers, at which it was voted to accept the proposal. A new general agreement was drawn up, covering wages and working conditions, which was signed by the company officials, representatives of the workers, and the conciliator. The employees returned to work Monday, May 12.

Machinists, Niagara Falls, N. Y., Tonawanda, N. Y., and Bradford, Pa.—In December, 1918, the Industrial Relations Division of the War Department requested the Department of Labor to assume jurisdiction in the machinists' controversies in the cities named above. The Industrial Relations Division of the War Department had been successful in keeping the machinists at work, but upon the signing of the armistice this service ceased to function, and the dispute automatically came to the Department of Labor for disposition. Commissioner Joseph R. Buchanan was delegated by the Department to work out an amicable adjustment. In this case the machinists were demanding the "Buffalo award," i. e., the scale of wages which had been put into effect in the city of Buffalo and to which industrial concerns engaged on Government orders had subscribed. The slackening demand for the output of these shops, incidental to the cancellation of war contracts since the signing of the armistice, had strengthened the determination of the employers to resist all further demands. This stand of the employers had incensed the men, who maintained that they had been tricked, inasmuch as they had remained at work at the request of the Government upon the assumption that their demands would receive recognition. Nearly 10,000 men were employed in the shops affected.

Commissioner Buchanan conferred with representatives of the men and urged that owing to the unsettled conditions prevailing they should not press their claim for increased wages, but should endeavor to secure a reduction in the number of hours worked per day, in order that a larger percentage of the workers could remain

at work pending the general slackness in trade. In these efforts he was successful. The matter was then taken up with the employers in a number of conferences and finally at a joint meeting of the Employers' Association of Niagara Falls and the chamber of commerce of that city the following resolution was adopted:

Whereas the manufacturers of Niagara Falls realize that there is likely to be unemployment during the period of readjustment from war to peace basis; and

Whereas the United States Department of Labor has requested the manufacturers in the interest of industry in the community during this period of readjustment to agree that the hours of labor in the factories will, where practicable, be cut down in lieu of making a reduction in the force: Therefore be it

Resolved, That we are willing and anxious to cooperate in any measure to reduce unemployment and we hereby adopt the said request of the United States Department of Labor.

No action on the proposition was officially taken by the employers of Tonawanda and Bradford, but the individual employers in those cities expressed sympathy with the action taken at Niagara Falls. In view of this resolution the employees were generally disposed to waive their demand for the adoption of the "Buffalo award," and a disposition was soon evidenced by both sides to wait until such time as a change in the industrial situation should warrant some other course.

Bakersfield & Kern Electric Railway Co.—On March 14 the Bakersfield & Kern Electric Railway Co. requested the good offices of Commissioner Charles T. Connell in adjusting a controversy which had arisen between that company and its employees at Bakersfield, Calif. The employees were platform men, and were members of the Amalgamated Association of Street & Electric Railway Employees of America, Local No. 869. The employees were demanding recognition of the union, an increase in wages, and better working conditions. Commissioner Connell suggested a modification of these demands in lieu of the fact that the National War Labor Board in its awards had consistently refused to allow recognition of the union where such recognition had not prevailed previous to the war-time period. On April 5 the local voted to strike as soon as it received the sanction of the international union. The commissioner immediately got in touch with the employees and urged that no precipitate action be taken pending further negotiations. In this he was successful. After a number of conferences in which the questions in dispute were vigorously discussed the men finally agreed to waive their claim for recognition. A joint conference was then arranged at which were present three union men, three nonunion men, three representatives of the company, and the commissioner. Every effort was made to obtain some sort of concession from the company in the nature of an increase of wages, but the result was unsatisfactory and a strike again threatened.

An international officer of the union appeared at this time and by his moderation and sense of fairness assisted materially in avoiding an open break. The company finally agreed that at some time subsequent to July 1 the question of additional compensation for the men would be given very careful consideration, and that if possible some advance would be made. This proposition was accepted by the employees and the threatened strike was averted.

Building trades, Memphis, Tenn.—On April 2 the secretary of the Memphis Builders' Exchange, Memphis, Tenn., wired the Department that the journeymen painters of that city had gone on strike after making excessive demands which had been turned down by the exchange. It was stated that arbitration had been refused by the painters but insisted upon by the employers association. The assignment of a commissioner of conciliation was requested. Commissioner William C. Liller was detailed to the case.

It soon developed that the painters were but one of several crafts involved in the controversy. The carpenters, plumbers and steam fitters, and paper hangers and decorators had also made demands which had been refused in part by the contractors. Conferences were held in an effort to arrive at a satisfactory conclusion. The old agreements were used as a basis of settlement and efforts to amend them to the satisfaction of both sides proved difficult. The manner of reaching an adjustment, however, finally proved successful and new agreements were signed to be effective until April 1, 1920.

Georgia Railway & Power Co., Atlanta, Ga.—On July 15, 1918, the Georgia Railway & Power Co. wired the National War Labor Board, stating that the employees of that company who were affiliated with the Amalgamated Association of Street & Electric Railway Employees of America had called a strike to be effective on the morning of the 16th of July, and that such a strike would undoubtedly result in complete cessation of street, suburban, and interurban traffic, including service to Camps Gordon, Fort McPherson, and Jessup. The War Labor Board referred the case to the Division of Conciliation for disposition and Commissioner of Conciliation J. W. Bridwell was immediately assigned and instructed to prevent a strike if possible.

The company had previously operated under nonunion conditions, but in compliance with the program as enunciated by the National War Labor Board it had recognized the right of its employees to organize into trade-unions and to bargain collectively through chosen representatives. The company maintained that in spite of this recognition the union employees had called a strike without notice or warning. Commissioner Bridwell worked energetically to prevent the inauguration of the strike, but the men nevertheless ceased work on the morning of the 16th. A strike had occurred on the lines

of this company in 1916, which after a long struggle had been lost by the men. They now demanded the reinstatement of the men who had been discharged at that time. However, after almost continuous conferences the men finally agreed to waive all demands except that for recognition of their union, and they stated that such recognition need not necessarily mean a closed shop. Both sides seemed anxious for a settlement and concessions were graciously made by both sides and an agreement reached which brought the strike to a close.

Cleveland building trades.—On May 2 the Building Trades Council of Cleveland, Ohio, wired the Department claiming a violation of the agreement existing between the Building Employers' Association of Cleveland and the various crafts constituting the building trades. The agreement mentioned had expired on May 1, and had by mutual consent been extended to May 6. The various crafts had remained at work pending an adjustment of their claims, except the electrical fixture workers who had ceased work on May 1. Acting upon the advice of the commissioner, A. L. Faulkner, the joint conciliation board agreed that negotiations between all trade committees should be resumed, and May 15 was set as the time limit for adjustment in all trades. If agreements could not be reached by that time, the disputes were to automatically revert to the conciliation board.

The magnitude of the controversy may be seen from the fact that 25,000 men were directly affected. Probably one-half as many more would also be involved if a strike were called. It was finally agreed to refer the questions in dispute to a board of arbitration. Each side then elected an arbitrator and these two agreed upon Commissioner Faulkner as the third man. The decision of the arbitration board granted the following award: Bricklayers, masons, and plasterers, \$1 per hour, effective May 29, ending April 30, 1920; electrical fixture workers, 80 cents per hour beginning May 1, 1919, and ending May 1, 1920, and 87½ cents per hour for the succeeding year; electrical workers, \$1 per hour, effective July 1, 1919, terminating May 1, 1920 (this was an increase of 10 cents per hour); carpenters, 85 cents per hour, effective May 1, 1919, with an additional increase of 5 cents per hour effective October 1, 1919. The adjustment of the building trades dispute in Cleveland was hailed with great satisfaction by both sides, and enabled business operations in that city to proceed uninterruptedly.

Nordyke & Marmon Co., Indianapolis, Ind.—A case of peculiar interest was brought to the attention of the Department on December 16, 1918, by Mr. L. C. Schwarts, business agent of the machinists' union at Indianapolis, Ind. It was alleged by Mr. Schwarts that the Nordyke & Marmon Co. had threatened to blacklist a number of

female employees who had recently left the employ of the company. Commissioner John J. Walsh was assigned to look into the matter and prevent, if possible, any serious consequences. This plant employed fully 4,000 workers and was engaged largely on Government contracts. It appeared that the difficulties arose through a misunderstanding which caused a number of female employees to tender their resignations. These employees were then advised by a tactless foreman that they would be blacklisted and would be unable to secure employment in Indianapolis. When this rumor spread to the large body of employees of the plant it caused murmurs of disapproval and dissatisfaction which threatened to become serious. Commissioner Walsh promptly got in touch with the general manager, who promised that under no circumstances would any employees be blacklisted or discriminated against in any way, and that he would gladly furnish recommendations to employees leaving the service of the company, and that letters of merit would be presented the female employees who had patriotically responded to the needs of the Government. The situation was then explained to the employees of the plant, who expressed their satisfaction at the outcome.

Dubuque Boat & Boiler Co., Dubuque, Iowa.—A case of alleged discrimination against a union employee threatened to bring about a strike at the plant of the Dubuque Boat & Boiler Co., located at Dubuque, Iowa. The matter was brought to the attention of the Department on May 3, 1919, by Mr. L. H. Bathurst, representing the boiler makers. Commissioner L. R. Thomas was detailed by the Department. Upon Mr. Thomas's arrival at the seat of the trouble he found that the employees of the plant, in addition to making a charge of discrimination, were also demanding recognition of a union committee and requesting adoption by the company of the scale of wages put into effect by the United States Shipping Board for the Great Lakes and Atlantic coast regions. The company positively denied the charge of discrimination, expressed a willingness to meet with committees of its employees, and agreed to submit the wage question, jointly with its employees, to the National War Labor Board for a decision. This proposal was agreeable to the employees and the difficulties seemed satisfactorily disposed of. The matter of presenting the matter to the board was then taken up, but by the time the data had been prepared the board had ceased to function. The men then to the number of 175 went out on strike. Commissioner W. H. Rodgers, who was then in the vicinity of Dubuque, was assigned to the case. He conferred with both sides concerned and then arranged a joint conference at which a settlement satisfactory to all concerned was finally negotiated. The men returned to work and a much better feeling was engendered. This company was engaged on the construction of barges for the Government.

Building trades, Sharon, Pa.—On May 14, the Department was requested by Mr. Bascess, of the Sharon Building Co., Sharon, Pa., to assist in adjusting a strike of carpenters and other building craftsmen which was interfering with the building operations at Sharon and vicinity. Commissioner of Conciliation James A. Smyth was selected to take up the matter. About a thousand men were involved in the dispute. Commissioner Smyth at once arranged for conferences at which the matters in dispute might be discussed. The carpenters had been on strike since April 1 for increased wages and better working conditions. They were demanding \$1 per hour for journeymen carpenters and a corresponding increase for helpers and less-skilled workmen. The old rate had been 70 cents per hour. After a number of conferences, the contractors were finally prevailed upon to grant an increase of 10 cents per hour. This increase, while not entirely satisfactory to the men, was finally accepted by them and building operations were resumed on May 26.

Steacy-Schmidt Manufacturing Co., York, Pa.—Lodge No. 243, International Association of Machinists, York, Pa., requested the assistance of the Department in adjusting a controversy which had arisen at York, between the Steacy-Schmidt Manufacturing Co. and its machinists. Commissioner L. R. Thomas was assigned by the Department on September 20, 1918. This controversy was brought about by the alleged discharge of an employee for union activities. About 400 men were involved. Mr. Thomas called at the office of the company and secured the reinstatement of the discharged employee, which satisfactorily disposed of the controversy and brought about much better relations between the company and its employees.

Building trades, tri-cities.—A controversy affecting the operations of the United States Housing Corporation in the tri-cities of Rock Island and Moline, Ill., and Davenport, Iowa, was reported on November 7, 1918. Commissioner G. Y. Harry was assigned to the matter. About 2,000 men were involved, including carpenters, electrical workers, painters, bricklayers, sheet-metal workers, plumbers, and steamfitters. A joint conference was arranged and an agreement drawn up which contained a plan of procedure for taking care of all grievances then existing or which might come up thereafter. The following rates of compensation were agreed upon to be in effect for a period of six months. Plumbers and steamfitters, 80 cents per hour; carpenters, 75 cents per hour; bricklayers, 81½ cents per hour; electrical workers, 70 cents per hour; painters, 70 cents per hour; sheet-metal workers, 75 cents per hour. This agreement satisfactorily disposed of the controversy and enabled the housing corporation to proceed uninterruptedly with its program.

Textile workers, Passaic, N. J.—On February 18, 1919, the Department was advised of a serious textile strike at Passaic, N. J. Commissioners James L. Hughes and Charles J. Fury were assigned by the Department to take up the matter. About 15,000 workers were found to be on strike. The demands were for a 44-hour week with the same pay as they were then receiving for 55 hours, which would amount, approximately, to a 35 per cent increase. The strikers were also asking recognition of the union known as the Independent Union of General Workers of the Textile Industries. The strike had been pending for a number of weeks and various conciliatory efforts by the mayor and other local officials had been unsuccessful. Commissioners Hughes and Fury put forth every possible effort to bring the strike to an end, but all efforts were unsuccessful until March 21, when an adjustment was brought about. The settlement was reached through the decision of both sides to submit the wage scale to Commissioner Fury for decision, all other questions having been previously adjusted.

Mahoning & Shenango Railway & Light Co.—The linemen employed by the Mahoning & Shenango Railway & Light Co. of Youngstown, Ohio, who had been working under a contract which expired on March 31, on the termination of the agreement, struck. The linemen, under the contract, had been receiving an hourly wage of 53½ cents and working a nine-hour day. On October 15, because of changed conditions, the hourly wage had been increased to 65 cents, which rate continued until March 31. Prior to the expiration of the contract, the men had demanded 95 cents per hour for the same day. This demand the company rejected, with the above-mentioned result. The company appealed to the Department of Labor for assistance. Mr. W. D. Davidge, commissioner of conciliation, was assigned to the case and reached Youngstown on the 12th. After a series of negotiations with the employer and employees, he succeeded in arriving at an agreement between them, under which the wages and other conditions should be submitted to an arbitrator to be appointed by the Secretary of Labor, the award of the arbitrator to be binding upon both parties.

In the meantime, at the request of Mr. Davidge, the company agreed, pending the appointment and decision of an arbitrator, to increase wages from 65 to 80 cents per hour, this appearing to him, under all the conditions and circumstances, to be a reasonable rate for the work to be performed. The arbitrator subsequently established the wage which the commissioner of conciliation suggested. On the execution of the agreement to arbitrate the men returned to work.

Pittsburgh Street Railway Co.—A strike of the street car men of Pittsburgh, Pa., in August, 1919, brought about an entire suspension of operations in that great industrial center. Commissioner Charles P. Howard was assigned on behalf of the Department. Upon his arrival at Pittsburgh, Mr. Howard found that a strike had existed two weeks and various unsuccessful efforts had been made to bring about a resumption of operations. The Pittsburgh Railway Co. was in the hands of receivers. The National War Labor Board had already handed down a decision in this case. The court recommended that the award of the board should be submitted to the State court, with the recommendation of the receivers that they be empowered to carry out its terms. The demand of the employees was for an increase of 12 cents per hour to bring the maximum rate to 60 cents, this being the rate paid in Detroit, Cleveland, and other cities of similar size. The award of the National War Labor Board was for a 12 per cent increase, which by adding fractions as directed, gave practically a 6-cent per hour increase instead of the 12 cents asked for. The employees had refused this proffered advance as being inadequate and had gone on strike for their original demands. All appeals to the strikers to return to work failed and an order from their international officers was ignored. The attempts to operate the cars with strike breakers were unsuccessful. Some damage to property had resulted and several arrests of strikers had been made upon warrants charging violation of the order of the court. A suit for damages in a large sum had also been filed against the Amalgamated Association of Street and Electric Railway Employees of America for breach of contract. Vice Presidents Fitzgerald, Reardon, and McGrath of the association conferred with the receivers for the purpose of agreeing upon terms upon which the strikers could return to work. Terms were finally arranged by which all men should be reinstated in their old positions with seniority rates restored. The men who had been arrested were to take their old places until such time as they should be proved guilty. Strike breakers who had been imported into the city were to be returned to the places from which they came as soon as practicable, no attempt being made by the receivers to operate cars until every opportunity had been given the strikers to return to work. A secret ballot was taken to decide the issue. After all possible pressure had been brought to bear upon the strikers a vote upon the proposal to return to work was taken and resulted as follows: In favor of ending the strike, 2,082; against, 408.

British Ministry of Food in the United States v. Chicago Egg Inspectors' Union.—A case of peculiar and unusual interest arose at Chicago affecting the supply of food under contract for the British

Government. It appears that a contract had been given for the candling and shipping of eggs to the Davies company, of Chicago. This company was alleged by the Chicago Egg Inspectors' Union to be employers of nonunion labor, mostly Negro girls. The union threatened to suspend all work being done for the British Government unless the Davies company were compelled to employ union help. Commissioner Oscar F. Nelson was assigned to the case on October 24, 1918. Mr. Nelson conferred with the British official representative and from him learned the situation. The contracts in Chicago were for an enormous shipment of eggs for the hospitals in France. Delay of any kind was serious, as arrangements for the shipping of the eggs had been made. A conference was arranged between the British representative, Mr. Horrocks, Mr. P. F. Donlan, business agent of the egg inspectors' union, and Commissioner Nelson. It was learned that the Davies company had sublet their contract to an egg broker who had had trouble with the union in the past; that he had employed Negro girls at wages decidedly less than the union scale; and that he had advertised his intention of teaching these girls the egg-candling business for the purpose of breaking up the egg inspectors' union. Such announcement had aroused the union and caused them to threaten strike.

As the Chicago Egg Inspectors' Union is a Federal labor union affiliated with the American Federation of Labor, Commissioner Nelson called into the conference Mr. John Fitzpatrick, president of the Chicago Federation of Labor, and invoked his good offices in bringing about an understanding. An agreement was finally drawn up and signed by Mr. Horrocks, Mr. P. F. Davies, representing the Davies company, John Fitzpatrick, president of the Chicago Federation of Labor, and Commissioner Nelson. This agreement provided that the egg inspectors' union agree to supply egg inspectors sufficient in number to do the work—which was approximately $2\frac{1}{2}$ to 3 cars per day, 500 cases per car, packed for export. It was further understood that the British Government would take up the matter of either having the company employ the members of the egg inspectors' union or secure cancellation of the Davies company's contract. These arrangements were to be consummated within 10 days.

Restaurant and theater employees, Washington, D. C.—During the period of the war, the various recurrent controversies between the waiters' union and the Washington hotels were handled to the satisfaction of all parties by Commissioner of Conciliation Rowland B. Mahany. He also adjusted all disputes during this time between the street railway companies and their employees. Mr. Mahany likewise brought about industrial peace between the theatrical managers and the men employed in the Washington theaters. Periodica

controversies between the bakers' union and the different baking establishments of Washington arose from time to time, and these difficulties, too, were composed in a satisfactory manner by Commissioner Mahany. These were all cases of first importance, a great number of minor ones being brought to the same happy conclusion. So that during the war period no city in the United States was freer from industrial unrest than the Capital City of the Nation.

Meat packing industry in Chicago; agreement between the packing houses of Chicago and their employees.—On April 12, 1919, the Secretary of Labor was notified by the presidents of five large packing-house plants in Chicago that they were willing to continue the agreement existing during war time for one year after the declaration of peace. The agreement mentioned was the one executed by the President's Mediation Commission, of which Secretary Wilson was chairman, in the winter of 1917-18, under the terms of which certain wages and conditions were agreed upon and Samuel Alschuler, of Illinois, judge of the Circuit Court of Appeals, was named as administrator.

The proposal for a continuance of the agreement was submitted to the representatives of the various crafts employed in the packing-house industry of Chicago and by them taken up for consideration with the workers. The workers, through their representatives, submitted a counter proposal providing for a continuation for one year after the declaration of peace, with some suggested changes as to methods of rehiring former employees, hearing grievances in the first instance, etc.

The Secretary of Labor selected Col. J. L. Spangler, of Pennsylvania and Ernest P. Marsh, of the State of Washington, members of the President's Mediation Commission, and Hugh L. Kerwin, director of conciliation, as his personal representatives, to proceed to Chicago and endeavor to harmonize the differences in order to continue the existing conditions in the packing industry. The representatives of the Department held conferences in Chicago for several days with the presidents of the packing houses and their representatives, and with the president of the Amalgamated Association of Meat Cutters and the representatives of the other crafts involved in the packing-house industry, and finally worked out a plan which was satisfactory to both sides. Approximately 50,000 workers are involved under this agreement. This result marks a new era in peace time in one of the most important industries in the country, and it is felt that the effect of this plan will be far-reaching.

Among the most important elements contributing toward the newer and better relationships in this industry has been the great service rendered by Judge Alschuler. There has not been a decision of his

that has not been religiously lived up to by both sides, and not a single thing has occurred during the entire period of his administration which has held up production in any of the packing houses in Chicago. It should be borne in mind that this plan completed to-day will carry with it not only a continuation during the period of one year after the declaration of peace of the present arrangements with the 5 big packers, but that 15 other packing plants in Chicago will come under the same arrangement.

Summary.—During the fiscal year the Department of Labor has assigned commissioners of conciliation to 1,780 cases, made up of 587 strikes, 1,113 disputes and threatened strikes, 63 lockouts, and 47 walkouts. Of these it has succeeded in adjusting 1,223, not including 219 referred to the National War Labor Board. In only 111 instances have the commissioners failed to make settlements. Thirteen cases are still pending. The number of disputes and the disposition of each is shown in the following tables, together with a summary by months, a record of the action taken in cases pending at the time of the last annual report, and a statement of the geographical distribution of cases as reported by months.

WAR LABOR ADMINISTRATION.**NATIONAL WAR LABOR BOARD.**

Origin and functions.—The National War Labor Board was created as a part of the War Labor Administration, and was the first of the organizations set up under the program outlined by the Advisory Council to the Secretary during the previous fiscal year. Among the things considered as vitally necessary at the beginning of the year 1918 was a treaty of peace between capital and labor. In order to arrive at some understanding for the term of the war, I called together representatives of each group. For this purpose I had requested the National Industrial Conference Board and the American Federation of Labor as the principal representatives of employers and wage earners, respectively, to send five persons each to a war

labor conference. Since it was recognized that it might be a matter of some difficulty to choose a chairman acceptable to both groups, each group was invited to choose a chairman who should preside on alternate days. Under this arrangement Hon. William Howard Taft, ex-President of the United States, and Hon. Frank P. Walsh, former chairman of the Industrial Relations Commission, were chosen.

The result of the conference was the establishment of a series of guiding principles which are now well known to the public and are set forth at length in my last annual report. For the purpose of making a concrete application of those principles in specific cases, it was recommended by the War Labor Conference Board that there be created a National War Labor Board to adjust labor disputes in industries manufacturing materials necessary to the conduct of the war. The same persons who had constituted the War Labor Conference Board were invited by me to become members of the National War Labor Board. This action was formally approved and confirmed by presidential proclamation on April 8, 1918. The original membership of the board was as follows: ¹ William Howard Taft, joint chairman and public representative of employers; Frank P. Walsh, joint chairman and public representative of employees. For employers: L. F. Loree, W. H. Van Dervoort, C. Edwin Michael, Loyall A. Osborne, B. L. Worden. For employees: Frank J. Hayes, William L. Hutcheson, William H. Johnston, Victor A. Olander, Thomas A. Rickert.

It was the intention of the President as expressed in the proclamation confirming the action of the Secretary of Labor to set up a board which should have broad and elastic powers and which might function as a sort of supreme court of industry. The exact intent of the President's proclamation is set forth in the following excerpt:

The powers, functions, and duties of the National War Labor Board shall be to settle by mediation and conciliation controversies arising between employers and workers in fields of production necessary for the effective conduct of the war, or in other fields

¹ The following appointments and changes in personnel have taken place: Thomas J. Savage to be alternate for Mr. Johnston; T. M. Guerin to be alternate for Mr. Hutcheson, May 13, 1918; F. C. Hood to be alternate for Mr. Loree, May 17, 1918; C. A. Crocker to be alternate for Mr. Worden, June 1, 1918; F. C. Hood to become principal on the resignation of Mr. Loree, June 1, 1918; John F. Perkins to be alternate for Mr. Osborne, June 1, 1918; Frederick N. Judson to be vice chairman and alternate for Mr. Taft, June 18, 1918; John F. Perkins to be alternate for Mr. Hood, June 27, 1918; H. H. Rice to be alternate for Mr. Van Dervoort, July 1, 1918; Wm. Harmon Black, to be vice chairman and alternate for Mr. Walsh, July 20, 1918; Matthew Woll to be alternate for Mr. Olander, July 24, 1918; John J. Manning to be alternate for Mr. Rickert, July 24, 1918; J. W. Marsh to be alternate for Mr. Michael, Sept. 1, 1918; on Oct. 9, 1918, the board was notified of the death of Thomas J. Savage; Fred Hewitt to be alternate for Mr. Johnston, Oct. 22, 1918; F. C. Hood resigned as member of the board on Nov. 19, 1918; P. F. Sullivan to be alternate for Mr. Osborne, Dec. 3, 1918; Frank P. Walsh, joint chairman, resigned as a member of the board on Dec. 3, 1918; Wm. Harmon Black, vice chairman and alternate for Mr. Walsh, resigned as a member of the board on Dec. 3, 1918; Basil M. Manly to be joint chairman, to fill the vacancy caused by the resignation of Mr. Walsh, Dec. 4, 1918; Wm. Harmon Black to be vice chairman and alternate for Mr. Manly, Dec. 4, 1918; John F. Perkins, alternate for Mr. Hood, to be a principal, to fill the vacancy caused by the resignation of Mr. Hood, Dec. 4, 1918; B. L. Worden resigned as a member of the board on Dec. 9, 1918; C. A. Crocker, to be a principal, to fill the vacancy caused by the resignation of Mr. Worden, Dec. 11, 1918; Harold O. Smith to be alternate for Mr. Crocker, Jan. 17, 1919; Granville E. Foss to be alternate for Mr. Perkins, Feb. 11, 1919; C. A. Crocker resigned as a member of the board on Feb. 24, 1919.

of national activity, delays and obstructions in which might, in the opinion of the National Board, affect detrimentally such production; to provide, by direct appointment or otherwise, for committees or boards to sit in various parts of the country where controversies arise and secure settlement by local mediation and conciliation; and to summon the parties to controversies for hearing and action by the National Board in event of failure to secure settlement by mediation and conciliation.

The principles to be observed and the methods to be followed by the National Board in exercising such powers and functions and performing such duties shall be those specified in the said report of the War Labor Conference Board dated March 29, 1918.

It was understood, however, that the establishment of this board was never intended to abridge in any way the normal work of conciliation and mediation by the Department. There could necessarily be no conflict, because the theories upon which the two were founded differed widely. The functions of the conciliator are essentially diplomatic in nature. He never acts as a judge or arbitrator. The essence of his service lies in the fact that he acts as a friend to both sides. His efforts are devoted wholly to securing voluntary agreements. In any controversy it must be recognized that the best result will spring from a self-imposed settlement. However admirable judicial procedure may be, the imposition of an arbitrary award by even a disinterested person acting as judge or arbitrator is not ideal for the settlement of disputes, although it is necessary where the parties to the disputes are themselves unable to adjust their difficulties. Hence the Conciliation Division devotes itself wholly to the settlement of cases by diplomatic instead of judicial methods.

In sharp contrast to this method was that of the National War Labor Board. Reference of a dispute to it was a presumptive indication that conciliatory methods had failed. Unlike the Division of Conciliation, it was not presumed to be a friend to both sides, except in the sense of being impartial. It was essentially judicial in its judgment of the cases and had the public interest solely in view.

Disposition of cases.—From April 30, 1918, to May 31, 1919, the board received 1,270 cases, 25 of which were consolidated with other cases, leaving 1,245 separate controversies which had to be passed upon by the board. Of these 1,245 cases, 706 (57 per cent) were referred to other agencies having primary jurisdiction or dismissed because of voluntary settlement, lack of jurisdiction, or for other reasons; 77 (6 per cent) are pending or remain on the docket as undisposed of because of divided vote or suspension; while in the remaining 462 cases (37 per cent) awards or findings have been handed down. In addition the board made 58 supplementary decisions in cases where action had already been taken, making a total of 520 formal awards or findings. This record within a period of less than 13 months is one which unquestionably has never been approached by any similar agency in the history of industry.

An analysis of the disposition of the 1,245 cases referred to is given in the following table:

Statement showing disposition of cases before the National War Labor Board to May 31, 1919.

Complaints received:

Joint submissions.....	193
Ex parte.....	1,052
Total.....	1,245

Disposition of cases:

Awards and findings made.....	1 462
Dismissed.....	391
Referred.....	315
Pending.....	23
Remaining on docket because board was unable to agree.....	2 53
Suspended.....	1
Total.....	1,245

As to the 315 cases which were received by the board and referred to other boards and agencies having original jurisdiction, the following table shows the number referred to each specified agency:

Number of cases referred to each specified agency.

Department of Labor, Division of Conciliation.....	164
Department of Labor, Employment Service.....	1
Railroad Administration, Division of Labor.....	13
Navy Department.....	6
Treasury Department.....	1
Post Office Department.....	8
Emergency Fleet Corporation, Industrial Relations Division.....	4
Emergency Fleet Corporation, Labor Adjustment Board.....	6
War Industries Board.....	3
War Labor Policies Board.....	1
Fuel Administration.....	6
Federal Oil Inspection Board.....	1
War Department, various divisions.....	24
War Department, Quartermaster General.....	8
Army Ordnance, Industrial Relations Section.....	29
Signal Corps and Aircraft Production Board.....	20
Board members.....	10
Officers of international unions.....	10
Total.....	315

It will be seen from the foregoing analysis that more than one-half of the complaints referred were sent to the Division of Conciliation of the Department of Labor with the object in view of having the differences adjusted, if possible, without recourse to formal proceedings before the board.

¹ Not including 58 supplementary awards, etc., in cases in which action had already been taken.

² These 53 cases represent actually only 3 case-groups, as one of the case-groups involves 51 docket numbers.

Of the cases removed from the docket of the board without action by formal award or finding, the greater number were dismissed without prejudice because of lack of prosecution or because the board was advised that the parties involved had entered into a formal agreement and no further action by the board was necessary. The following table shows in detail the number of cases removed for each reason specified:

Cases removed from docket for reasons specified.

Lack of jurisdiction.....	93
Lack of agreement.....	11
Lack of prosecution.....	159
Voluntary settlement between parties.....	116
Withdrawal.....	12
Total.....	391

It should be noted that cases removed from the docket required in many instances as careful consideration by the board or its staff as those cases in which formal awards or findings were made.

Analysis of the work of the board by months, May, 1918, to May, 1919.—An interesting insight into the volume of work which might have been developed by the board had not the armistice been signed is set forth in the following table, which furnishes a review of the work of the board by months during the 13 months ended May 31, 1919:

Month.	Cases placed on docket.			Awards and findings made.				
	Joint submissions.	Ex parte.	Total.	Industrial.	Public utilities.	Total.	Supplementary actions.	Total actions.
May to July.....	38	208	246	13	21	34	-----	34
August.....	29	96	125	4	-----	4	-----	4
September.....	39	180	219	8	-----	8	2	10
October.....	18	133	151	14	12	26	3	29
November.....	24	251	275	17	21	38	3	41
December.....	13	55	68	17	8	25	9	34
January.....	9	78	87	43	12	55	10	65
February.....	3	70	73	35	12	47	6	53
March.....	15	1	16	114	7	121	11	132
April.....	1	4	5	79	9	88	11	99
May.....	4	1	5	15	1	16	3	19
Total.....	193	¹ 1, 077	¹ 1, 270	359	103	462	58	520

¹ Including 25 docket numbers consolidated.

The rapid expansion of the work of the board during the period of actual hostilities is at once apparent from an examination of the foregoing table. At the time of the signing of the armistice the board had acted on 455 cases but had made only about 72 formal awards and findings, due to the fact that special attention had been given to important cases involving the production of large quantities of munitions, ordnance, and essential war materials. After the signing of the armistice a resolution of the board provided that no new cases except

joint submissions would be received by the board after December 5, 1918. Altogether there have been received during the six months since the armistice only 423 new cases, as compared with 847 cases entered on the docket during the six months prior to the armistice. During the six-month period since the armistice the board has acted on the 375 cases which were pending when the armistice was signed as well as approximately 400 new cases which have been docketed.

Executive sessions of the board.—During the summer of 1918 and up to the time of the signing of the armistice in November of the same year an executive session of the full board or its standing committee was held each week. The usual practice was for the standing committee to meet one week and the full board the following week, although the pressure of work at times was so great as to require the full board to remain in session continuously for a longer period than a week. Altogether 104 days were devoted to executive meetings by the board during the year. This does not include the considerable periods which the board spent in conducting public hearings. As almost all the members had other important duties to perform, the policy was adopted of each member appointing an alternate to represent him when his presence was required elsewhere, so that the adjustment of important matters before the board might not be delayed.

Scope of board's awards.—A careful tabulation of the data in the files shows that up to May 22 the awards and findings of the board (excluding 11 for which the information is lacking) directly affected 1,084 establishments employing 669,496 persons, of whom 80,271 were employees of street railways. These numbers, it is to be emphasized, include only those persons who were specified directly in the terms of the decisions. In very many cases the decision was applied in practice to other employees of a plant than those in whose names the controversy was filed.

. Of still more importance is the fact that very frequently a decision in regard to one company was accepted by other companies similarly situated. The information on this point is very limited, but it is known that in very many instances controversies were settled voluntarily or by other adjustment agencies on the lines laid down by existing decisions of the board. Thus it is known that the decision of the board in the Bridgeport case was accepted and applied in the plants of the Remington Arms Co. in other places; and that the street railway decisions have been the basis of voluntary adjustment in Philadelphia, Washington, and many other cities.

Indeed the "principles" of the National War Labor Board as laid down by the Conference Board and as interpreted by the War Labor Board had a vastly wider influence and acceptance than indicated by any mere numerical statement of the persons directly

affected by the decisions of the board. Other governmental adjustment agencies—such as the Industrial Service Section of the Ordnance and other branches of the War Department, as well as the labor adjustment divisions and boards of other procurement divisions of the Government—have used these principles and precedents as a manual in their own adjustment work. Moreover, the conciliators of the Department of Labor, whose work during the war has been of far-reaching importance, averted many difficulties by citing the principles and precedents of the board to the parties in controversy and working out an adjustment thereunder.

Of special interest, also, is the large number of strikes and lockouts averted or called off as a direct result of the board's intervention. The exact number is unknown, but the records show at least 138 instances of this character.

Origin of cases.—The proclamation of the President creating the National War Labor Board conferred upon it jurisdiction in all controversies "in fields of production necessary for the effective conduct of the war, or in other fields of national activity, delays and obstructions in which might, in the opinion of the National Board, affect detrimentally such production."

The jurisdiction, as regards subject matter, thus conferred upon the board was extremely broad, inasmuch as in the reorganization of industry on a war basis there existed very few business activities which did not affect, directly or indirectly, the effective conduct of the war. This is indicated by the fact that the board dismissed fewer than 50 complaints on the ground that war production was not involved.

In practice, however, the jurisdiction of the board was greatly and desirably limited by the further provision of the proclamation that the board should refuse to take cognizance of a controversy "in any field of industrial or other activity where there is by agreement or Federal law a means of settlement which has not been invoked."

This provision excluded from the consideration of the board, except by way of appeal, large groups of cases where the parties concerned had provided by voluntary agreement for other means of arbitration or where Federal law had provided other arbitration agencies. Thus the vast shipbuilding industry had set up by agreement its own labor-adjustment board; the Ordnance Department and other producing departments of the Government had provided special industrial service sections to consider the complaints of their employees; and the coal-mining industry had its labor conditions controlled by agreement of all parties with the Fuel Administration. In this way, in a number of the most important industries, means of adjustment of disputes had been arranged for, and controversies therein could reach the board only on appeal. The procedure of the board provided, more-

over, that appeals would be heard only on the ground that the principles of the President's proclamation had been violated, or that either party to an award had violated it, or to determine questions of jurisdiction as between Government boards. In no case was an appeal permissible on question of fact.

The cases which came to the board on appeal from decisions of other boards were very few. Perhaps the most important of these was the New York Harbor case, which came up on appeal from the New York Harbor Wage Adjustment Board.

A very large number of cases, however, came to the board by way of reference from conciliation agencies—such as the Department of Labor—which had been unable to adjust the matters in controversy. Thus of the 462 cases in which the board made awards and findings almost exactly one-third came by way of reference from other agencies and two-thirds by way of direct complaint to the board. Most of the cases coming by reference were from the Department of Labor, but some of the most important were referred by the War and Navy Departments and had been previously handled by the Industrial Service Sections of these departments. Such were the St. Louis cases, the Bridgeport cases, the Worthington Pump case, the Smith & Wesson case, and the Newark (N. J.) machinists' cases.

It is also of interest to note that of the complaints brought directly to the National War Labor Board about 12 per cent were made by employers or employers' associations; the remainder were made either by groups of employees or, in the case of union shops, by their union representatives.

Execution of awards.—The board was given no legal authority to enforce its decisions. In case of joint submission the parties had, of course, the right of legal redress as in all cases of violation of contract. Otherwise the execution of the board's decisions depended on the support of public opinion, the support of other governmental agencies, and the obligation laid upon employers and employees by their chosen representatives in the formation of the board and the drafting of its principles.

Particularly during the period of active hostilities the powers of the procurement departments of the Government—such as the War and Navy Departments—were very great, and these powers, as well as the influence of the President himself, were consistently used in support of the awards of this board. The most striking cases of this kind were the Bridgeport and Smith & Wesson cases. In the former the President told the striking employees he would use the Federal Employment Service and other branches of the Government to their disadvantage if they did not accept the board's award. In the Smith & Wesson case the War Department immediately took over the plant of that company when it refused to abide by the board's decision.

The outstanding fact, however, is that, as long as active war was on, the decisions of the board were accepted almost without exception both in ex parte cases and in cases of joint submission. Since the armistice, and more particularly since the first of the year, the changed industrial conditions, the questioning in some quarters as to the board's authority in the intermediate period between the armistice and the proclamation of peace, and the uncertainty in some minds as to the continued existence of the board, have combined to create a condition when the board's decisions have been less spontaneously accepted.

Hearings by board and examiners.—When the number of submissions to the board became so great as to render hearings by examiners necessary, such hearings almost entirely supplanted hearings before board members. In addition to the heavy requirement of considering the testimony secured by examiners the board heard only cases of peculiar difficulty or listened to oral argument in cases in which the testimony had previously been submitted to examiners. In total there have been 488 hearings held by the board members and by examiners, hearings by examiners being 321, or 66 per cent of the total.

The hearings were distributed as follows:

Hearings held before—

Umpires.....	20
Full National War Labor Board.....	59
Recess or standing committee.....	6
Joint chairmen.....	46
Joint chairmen and section.....	2
Double section.....	1
Board and section.....	1
Sections.....	32
Examiners.....	321
Total.....	488

During the months of greatest activity examiners' hearings averaged about 15 per week, and in view of the length of many hearings and their wide separation geographically, this involved the need of some 30 examiners. Usually the hearings were held at the place of controversy. This was done primarily for reasons of economy, as it was much less expensive to send an examiner with necessary assistants to another point than it was to pay the expenses of representatives and witnesses to Washington. The policy adopted was to assign only one examiner to a hearing, except in cases of particular difficulty or complexity; but this policy could not always be observed, owing to the need of breaking in new examiners, a process which could be best accomplished by sending a new man with a more experienced examiner, in order that he might get practical training.

Special field representatives.—At the outset of the board's work it was thought that beneficial results might be obtained by having representatives, designated by the employers' and employees' groups, make preliminary investigations of complaints which were brought before the board. It was expected that these special field representatives might be successful in mediating or adjusting differences, or could prepare special reports as to the facts involved for the consideration of the board. Later these special field representatives were instructed to assist the parties to a controversy in preparing their cases for hearings. This procedure, while sound in theory, did not work out satisfactorily in actual practice, for the reason that it tended to extend or accentuate the original differences as to which complaints were made. As a consequence, in the procedure as finally adopted by the board the use of special field representatives was discontinued.

Administration of awards.—The policy of the board has been always to encourage to the greatest possible extent the self-administration of its decisions. In practice, however, even the best drawn awards almost always left room for divergent interpretations. If the differences were small, adjustment could be made by correspondence, but in case of major differences the sending of an examiner as an interpreter and administrator proved to be the only alternative to having the parties bring their difficulties direct to the board. The demand for such service was particularly acute in cases where an award provided for collective bargaining in a plant where collective bargaining had not previously existed. Often the parties in such cases were completely at a loss as to how to begin such a system and imperatively needed counsel with some one familiar with the processes of installing shop-committee systems.

A large number of awards specifically provided that an examiner—or administrator, as he came to be called—should be sent to interpret the award. In addition, a great number of requests for administrators have been received in cases where the award did not specifically provide for the sending of an administrator or where such action was contingent upon a request made by one or both parties. The number of administrators available has never been sufficient to meet all of the requests made. Moreover, the demand for the services of administrators has steadily increased as more and more decisions were rendered by the board, and at present there is a greater demand for such services than at any previous time.

In total, 180 awards and findings have been administered by the Department of Administration of Awards. Administrators have been present in person in 128 cases. The maximum number of administrators at the time of greatest activity was about 25.

The administration of the street railway awards was susceptible of a high degree of standardization. They had a common authorship—all of them were written by the joint chairmen; they related to a single industry of remarkably homogeneous character; and, usually, the employees were highly organized and both parties had been accustomed to collective bargaining.

The industrial awards, on the other hand, presented a bewildering variety of conditions, and have, in many cases, necessitated the installation of elaborate machinery for collective bargaining. A notable instance of this is the Bridgeport case, where over 60 establishments, employing 60,000 persons, were involved. It is of much interest to note that the system of department and works committees established under this award has been accepted by both parties as a permanent institution.

Another striking item in the history of the administrative work was the statement of officials of the Corn Products Refining Co. (Docket No. 130) to the administrator of the board, that the expense of the award to the company, amounting to a million dollars or more, was more than compensated for by the improved classification of occupations worked out by the board and its examiners and by the greater security of industrial relations secured by the award.

Organization of staff.—One of the most burdensome duties was that of organizing a staff. In the first place, there was the difficulty of securing capable assistants at a time when the pressure on the board for prompt action was greatest and when the man power of the country was in greatest demand for war purposes. More than balancing this, however, was the fact that the work offered in the service of the board was of a character to attract men of the highest grade.

A second and even more important difficulty was the uncertainty as to the character and amount of work which was to be intrusted to the staff. For the more or less routine duties—such as the Files and Docket, Buildings and Supplies, and Auditing Divisions—the work could be forecast with more or less accuracy, but the work of the judicial and administrative examiners—which in time became the most characteristic and important branch of the staff organization—was a matter of development and could not be anticipated at all fully. Thus at the start of its work it was the evident intention of the board, itself or by sections, to hear the parties to each controversy submitted to it. The rapid accumulation of cases submitted, however, soon made such a course physically impossible, and the policy was then adopted of employing a staff of judicial examiners who might take the testimony of parties for digesting and presentation to the board. This use of examiners, however, grew up slowly, through requests of the board and its sections in individual cases, and it was not until some two and a half months after the board's organization that defi-

nite authority was given the secretary of the board to handle controversies in this manner.

Similarly, the provision of administrators to interpret the board's decisions grew out of the necessities of the moment. The award in the Waynesboro machinists' case was the first recognition of the principle that the board in making an award retained jurisdiction and might assume the duties of helping both parties to put the award into effect. Slowly this became the accepted practice of the board, and as a result the need arose for a staff of special administrative examiners to aid the parties in interpreting and applying awards.

The maximum number of employees on the staff of the board was approximately 250. This point was reached immediately before the signing of the armistice.

Special reports and archives.—Prior to the dissolution of the board detailed reports from the departments of the organization were prepared as follows:

1. Department of Procedure.
 - (a) Division of Complaints.
 - (b) Docket Division.
 - (c) Division of Public Hearings.
 - (d) Official Reporting.
2. Files and Information.
 - (a) Files Division.
 - (b) Editorial Division.
 - (c) Publications Division.
3. Department of Examinations.
 - (a) Division of Investigation.
 - (b) Division of Analysis.
 - (c) Cost-of-Living Division.
4. Administration of Awards.
5. Department of Office Management.
6. Department of Auditing and Accounts.

Three special reports have also been prepared which are likely to be of historical and scientific value. They are as follows:

1. Report on the administration of awards, by Erville B. Woods.
2. The work of the public utilities division, by Charlton Ogburn.
3. Analysis of the awards and findings of the board, by Robert P. Reeder.

The awards, findings, orders, or actions of the board in all cases which have come before it also have been collected and arranged according to docket numbers and in bound form.

Discontinuance of the board.—The National War Labor Board, having been created as part of the war machinery, passed out of existence with the termination of the fiscal year. Its service had covered a term of barely 14 months, only one-half of which was within the

period of active hostilities. During that period the board developed by the force of circumstances into a supreme court of industry. As to its success in such a rôle there can be no reasonable doubt. Over and over again it demonstrated its effectiveness in adjusting industrial disputes and thereby securing maximum production, when such disputes menaced the success of the war. By the nature of its organization and the character of the principles followed it almost invariably was able to secure adjustment on a basis of right and justice that appealed as such to the judgment of all fair-minded men.

DIVISION OF NEGRO ECONOMICS.

Origin and functions.—In previous years the attention of the Department had been repeatedly called to specific labor problems involving race relations. Perplexing questions frequently arose with regard to Negroes in industry. With the greater industrial efficiency demanded by the war a more harmonious adjustment of the labor relations between whites and Negroes was imperative, especially in view of the fact that the latter race makes up over one-tenth of our total population and includes about one-sixth of the working population. It has long been the policy of the Department to avail itself of the best expert knowledge obtainable with reference to its problems. Hence a Negro adviser to the Secretary of Labor was appointed as Director of Negro Economics. His function is to advise the Secretary on matters affecting Negro wage earners and to outline and direct plans toward greater production. This step was taken not only because the advice of an expert was necessary but because it was felt that a race which made up such a large share of our industrial army and had contributed so generously to our military and naval forces was certainly entitled to a seat at the Secretary's council table when matters affecting its interests were considered. The work of this division since its establishment has amply justified its creation, and my policy has been to refer to it for advice concerning the administration of all problems peculiar to Negroes as wage earners.

Method of organization.—The administration of the work of this division has had for its basic idea the view that repressive measures are inadvisable and that the interests of the races are best promoted where cooperative relations exist between white and colored leaders. The Director of Negro Economics consequently promoted the organization of cooperative committees of white and colored citizens in the States and localities where labor problems existed. The nature of such work made a field force necessary, and a staff of State supervisors of Negro economics was intrusted with the local administration of such policies as were formulated. Since many of these policies related to the employment functions of the Department the supervi-

sors necessarily worked in cooperation with the field staff of the United States Employment Service.

The utility of the plan outlined and carried out during the war proved to be of equal value in many of the reconstruction questions involving white and colored wage earners and their relations to white employers which have arisen since the signing of the armistice.

Questions of race relations will probably affect and modify labor problems for an indefinite period. The combination of white and colored citizens as volunteers on local Negro workers' advisory committees, cooperating and advising together, and with the officials of the Department of Labor, may be regarded as a most desirable means of securing the largest results in applying to local problems the wider experiences, policies, standards, and needs of the Nation.

The two races are thrown together in their daily work. The majority of the employers and a large number of fellow employees of Negro workers are white persons. This condition gives rise to misunderstandings, prejudices, antagonisms, fears, and suspicions which must be removed by mutual understanding and cooperation. Therefore the plan and program of the Department as carried out in this matter has been based upon the principle of cooperation of white employers, Negro workers, and, wherever possible, white workers.

Conferences and field organization.—Prior to my last annual report, State Negro workers' advisory committees, made up of representative Negroes and cooperating white citizens, had been appointed in Florida, Georgia, Mississippi, North Carolina, Ohio, Virginia, and Kentucky. Following State conferences of white and colored citizens, committees were formed in Illinois, Michigan, and New Jersey. A State conference was held in Missouri, and local committees were formed in Pennsylvania without holding a State conference. County and city committees were appointed in 10 States, making in all about 225 local committees. The State supervisors of Negro economics and the special agents working in cooperation with the United States Employment Service were continued in 10 States.

The good feeling and understanding developed through these conferences and local and State committees were widespread in their effect; so much so that on February 17 and 18, 1919, I called an informal conference of 45 welfare boards, agencies, and organizations dealing with Negro life. White and colored representatives to the number of 151 responded to the call and recommended to the Department a line of procedure and a plan of work for increasing the efficiency and opportunities of Negro wage earners and for improving their relations to white workmen and white employers.

Report on Negro migration in 1916-17.—The investigation of Negro migration, undertaken under the direction of Dr. James H. Dillard, of Charlottesville, Va., as mentioned in my last annual report, has

been printed and published. More than 2,000 copies have already been put into the hands of interested citizens throughout the United States. Copies have been placed in all the principal libraries, and from many persons in all parts of the country have come high words of commendation of the timeliness and value of the report. A valuable investigation of the experience of the Negro in industry was also begun through the Investigation and Inspection Service. Much material was gathered, but from lack of funds it has not been completed.

Samples of work accomplished.—(1) The United States Employment Service of the Department has necessarily received the largest amount of assistance, North and South, in connection with the recruiting and placement of Negro wage earners. The Federal State directors of that service in 10 States depended for advice and assistance almost entirely upon the field staff of the Division of Negro Economics on practically all matters relating to Negro labor. In Virginia and Alabama special assistance was given in developing the Boys' Working Reserve among Negro boys.

(2) The Woman in Industry Service, the Investigation and Inspection Service, the Children's Bureau, the Conciliation Service, the Bureau of Industrial Housing and Transportation, and other branches of the Department were served in a cooperative way in their dealing with Negro wage earners.

(3) Educational and efficiency campaigns were carried on throughout the territory to inform Negroes of the relation of their work to the winning of the war and the necessity for 100 per cent production. These campaigns gave stimulation also to amicable relations between white and colored workers and white employers. This work was carried on through mass meetings and audiences in churches, lodges, and welfare societies, and by means of posters, publicity to all the Negro newspapers, etc. Shop talks on the Nation's needs, race pride, promptness, regularity, full-time work and increased opportunities for large earnings have been given. Employers gladly arranged hours for such talks and commended the efforts.

(4) Advice was given to employers on matters of sanitation in industrial towns and camps. Employers were appealed to on the ground that proper conditions produce greater regularity, stability, and contentment among Negro workers.

(5) Through consultation with State and city officials and with those leading in labor distribution, the superior effectiveness of publicity and persuasion over against compulsory measures as a means of securing efficient work was shown. For instance, in Norfolk, Va., a labor shortage committee proposed to have a drive to compel men to go to work or go to jail. Through the advice of the local Negro workers' advisory committee a plan for a 10-day educational cam-

paign to appeal to the Negro laborers was substituted for the work-or-jail plan. The result was more Negro applicants for the work than were needed at that time, and this became a basis for the further stimulation of Negro labor.

(6) Such methods of stimulation reduced the labor turnover and absenteeism in a number of plants as shown by statements of many employers.

(7) The promotion of stability and thrift among Negro wage earners may be illustrated by the effect of the "own-your-own home" effort in Ohio. The supervisor of Negro economics gathered information about the laws and operations of building and loan associations and sent out information to the Negroes throughout the State. The result, in four months, was a series of extension lectures in three cities to Negroes by one of the universities, the establishment of three well-organized Negro building and loan associations in three cities, and plans for five others in as many different cities of the State. The effect of this work on the communities, and especially on the Negro workers, has been far-reaching, according to the testimony of both white and colored citizens.

WAR LABOR POLICIES BOARD.

Origin and functions.—Among the war problems of the Department was that of regulating the relations of services and bureaus in the Departments of Labor with similar services and bureaus in other departments. In the fixing of wages and working conditions, for instance, adjustment boards and agencies existed in practically every production branch of the Government. The work of these agencies was frequently in conflict, and it was highly desirable that their policies be unified and that the boards themselves work in harmonious relations with one another. Nor were such conflicts of authority confined to the adjustment of labor disputes. There were incompatibilities with regard to the supervision of working conditions, housing, and many other functions of the Department of Labor. As a means of bringing these agencies into mutual relationships, there was created by the Secretary of Labor a War Labor Policies Board, composed of the chiefs of the various bureaus and services of the Department, together with representatives of the other production departments of the Government.

The board was established on May 13, 1918, with Mr. Felix Frankfurter, Assistant to the Secretary of Labor, as chairman. Its first meeting was held on May 29, 1918. The departments, boards, and administrations represented besides the Department of Labor were the War Department, the Navy Department, the Department of Agriculture, the United States Shipping Board, the Emergency

Fleet Corporation, the Fuel Administration, the Food Administration, the Railroad Administration, and the War Industries Board. In addition to members representing these branches of the administration, the Policies Board had advisers representing organized labor and other experts and technicians who qualified in business management and other technical fields.

The need for the War Labor Policies Board arose from the fact that the Federal Government had become the greatest employer in the country. And although the Government represented one people and might therefore be expected to have a single broad policy toward labor, the first year of the war had brought out many diverse policies from that single Government. The inevitable result was that the National Government, operating through different agencies, was saying and doing irreconcilable things. Each of the labor policies announced by each of the branches of the administration could not be right, because many of them were mutually contradictory.

The function of the board was to reconcile such differences so far as they referred to administration of labor matters and to recommend to the Secretary unified labor policies to harmonize the industrial activities of separate branches of the Government. It was well adapted to this end, since—although it was created by the Secretary of Labor and operated under his direction—it included responsible representatives of other branches of the Government.

Elimination of labor turnover.—The chief problem to be faced was the wastage which arose from labor turnover. This evil was magnified by competitive recruiting on the part of persons employed by or operating on behalf of the Government. Private labor agencies and private businesses were also insistently seeking the labor needed for vital war work. To eliminate this waste and to assure a sufficient number of workers for war purposes the board recommended the policy of central recruiting of unskilled labor through the United States Employment Service. With the approval of the Secretary of Labor and by presidential announcement this policy was put into effect on August 1. Plans were also made for the recruiting of skilled labor similarly, but they never became operative by reason of the armistice.

Adoption of uniform standards.—Diversity in the conditions and standards of employment in the different governmental agencies were a second cause of industrial disturbances and of labor turnover resulting in a decrease in output. To harmonize such diversities the board devised and recommended clauses for insertion in the contracts executed by the war production departments. These clauses dealt with the questions of child labor, contract labor, the Federal eight-hour laws, the enforcement of State laws, and the submission of labor disputes to arbitration.

For the enforcement of such of these provisions as related to labor standards the cooperation of State labor bureaus was secured. These State agencies were authorized to enforce the contract provisions by the Federal departments responsible for the execution of contracts. In order to obtain a satisfactory understanding with State organizations a conference was held on September 30 and October 1, at which 34 States were represented.

Industrial exemptions.—The War Labor Policies Board also developed and recommended to the provost marshal general a system of furloughing skilled laborers in order to minimize the disorganizing effects of the draft upon essential industries. Another plan, providing district draft boards with industrial and agricultural advisers, was designed by the board and also adopted by the provost marshal general. In accordance with this plan exemptions for industrial needs were determined on the basis of national rather than local requirements.

The rapid growth of many communities due to the establishment of war industries produced living conditions which made it impossible for workers to maintain their efficiency. To correct these evils the War Labor Policies Board recommended that the Department of Labor establish a Commission on Living Conditions of War Workers, the duties of which were to cooperate with governmental departments and local agencies in securing proper living conditions for workers in war industries. The recommendation was approved by the Secretary of Labor, and a commission of five members was appointed October 16 as a part of the Bureau of Industrial Housing and Transportation.

Wage stabilization.—One of the chief obstacles to the proper distribution of labor had been the variations in wages paid by different contractors for the Government. These differences were frequently of considerable magnitude, even within the same city and for the same trades. This resulted in a tremendous turnover of labor which seriously interfered with productive efficiency. It was the individualistic strike. It represented the individual workman dissatisfied with conditions who was either unwilling or unable to enlist his fellow workman in a collective protest. It was much larger in the aggregate than all of our strikes. Something had to be done to reduce it to a minimum if our war-industry effectiveness was to be maintained. It was apparent that only some system of standardization of wage rates would accomplish the desired results.

Every collective wage agreement entered into between employers and employees establishes standard wages for the period of its existence and to that extent has a stabilizing effect. It reduces unrest to a minimum because employers and employees are alike parties to the agreement. Any policy of standardization determined upon by the Government to reach its effectiveness had to give to the

employer and employee a voice in determining the wage standards that were to be introduced. This policy was pursued in the creation of the various wage-adjustment boards. These did not cover all of the field except in the case of the National War Labor Board, and in that case jurisdiction did not begin until the spirit of unrest amongst the workers had reached the stage of creating a labor dispute. Standardization with a view to preventing the unrest was never undertaken in the general field of industry. In order to cover that neglected field, the board perfected plans for the formation of a Building Trades Board and a Metal Trades Board, composed of representatives of employers, employees, and the Government, to deal with problems that arose outside the jurisdiction of the Shipbuilding Adjustment Board and the Railroad Board of Wages and Working Conditions. Plans were being worked out for the creation of additional boards in other essential industries when the signing of the armistice eliminated the need for further action.

Profiteering.—Directly related to the question of wage stabilization is the problem of the steadily increasing cost of living. The Department realized that to regulate wages without at the same time meeting the question of the rising costs of the services and materials which the worker purchases with his wages would be dealing in half measures. Accordingly the question of price control was referred to the War Industries Board, the Food Administration, and the Department of Agriculture, with the request that they proceed as rapidly as possible with the formulation and enforcement of plans for the increase of production and the stabilization of the prices of the necessities of life and the elimination of profiteering through the equitable limitations of profits.

Employment of women.—The reduction in the available labor supply due to the draft resulted in a steady increase in the employment of women. The Department has held the protection of women against the hazards resulting from their entry into industry of prime importance. A statement of the policy of the Government with regard to the employment of women was adopted which included principles to be observed in occupations employing women and the safeguards which should be provided for them. Since administration of this policy has been assigned to the Woman in Industry Service by the Secretary of Labor, a detailed description of the principles included within that policy are set forth in that part of this report which describes the operation of the latter service.

Plant surveys.—Realizing that the scientific utilization of industrial plants was the first requisite in securing maximum production, the board devised a plan for surveys to be made by the community labor boards of the Employment Service, under the direction of the War Industries Board, to ascertain the extent to which plants capable of being utilized for war production were being employed and

to devise means for the conversion to war uses of plants now fitted only for production of nonessentials.

These are some of the more important matters which have been dealt with by the War Labor Policies Board. Other problems affecting one or more branches of the Government found their way to this board for reference. To them all this board brought the light which arose from common counsel of separate agencies working on the single task of exerting the full energies of the Nation in the prosecution of the war.

Abolition of the board.—The contingency which brought the War Labor Policies Board into existence was the divergence of policy in labor matters brought about by the creation of large numbers of Government agencies to deal with labor. With the cessation of hostilities the greater part of the agencies mentioned also ceased, and with their disappearance there ceased to be any necessity for a centralizing agency. Consequently the jurisdiction of the War Labor Policies Board rapidly dwindled. Before the end of the fiscal year it was possible to discontinue the entire staff. Although the necessity for reconciliation of interdepartmental conflicts had passed the function of course remained of reconciling differences between branches of the Department. This function, however, is sufficiently provided for by the normal organization of the Department and by the Departmental Cabinet (q.v.). The Policies Board was therefore discontinued in March, 1919.

WOMAN IN INDUSTRY SERVICE.

Origin and functions.—The Woman in Industry Service¹ was organized in July, 1918, a year and three months after the entrance of the United States into the war. It is charged with the duty of developing standards and policies to insure the effective employment of women while conserving their health and welfare. It was instructed to keep in close touch with the other divisions of the Department of Labor, each of which has a relation to women in industry, and to coordinate such work in other Federal departments. It is expected to work with State departments of labor. Its aim is to unite in the active carrying out of a consistent and rounded program by all the agencies which touch various phases of the problem of women wage earners. It was confronted at once by the problems involved in a rapidly increasing reliance upon the work of women as a reserve labor force in the face of the withdrawal of men for military service at the rate of a quarter of a million a month. It was clear that for the sake of production the Federal Government must pro-

¹ At the beginning of the fiscal year 1920 the title of the Woman in Industry Service was changed to the "Women's Bureau."

vide not only for the recruiting of women workers but for the safeguarding of the health and efficiency of these women who were meeting the requirements of new and unaccustomed tasks.

This rapid increase in the employment of women constituted a peculiar war problem. Fundamentally, however, the purpose of the Department of Labor in its relation to women in industry is identical in peace and in war. With all the changes brought by the war the organic act creating the Department is still applicable: "The purpose of the Department of Labor shall be to foster, promote, and develop the welfare of the wage earners of the United States, to improve their working conditions, and to advance their opportunities for profitable employment." The difference during the war was the wider public recognition of the necessity for "advancing the opportunities" of women "for profitable employment."

Thus, while the problems of women in industry during the war differed in form from similar problems in time of peace, the fundamental tasks were so much alike that the experience gained in dealing with them during the war may be regarded as a basis for action in time of peace. A report of the activities and plans of the Woman in Industry Service in the four months which elapsed between its establishment and the signing of the armistice should, therefore, be not merely a history but an introduction to a program for the work of the Federal Government on behalf of women wage earners in the period of readjustment and thereafter. Therefore, logically the record divides into two parts, the first describing the period of the war and the second setting forth the problems of the eight months after the armistice was signed.

ACTIVITIES DURING THE WAR, JULY 16 TO NOVEMBER 11, 1918.

When the Secretary of Labor recommended to Congress an appropriation for a special service for women in industry, he outlined its purpose and functions as follows:

It is undoubtedly true that the Department of Labor exercises all of its powers with reference to wage earners of both sexes and of all ages. It is also true that the best administration requires that the various services of the Department which are here outlined be conducted by including within the work of each service all questions regarding women as well as men.

But the great importance of the employment of women in most essential war work and the development of special matters of policy with respect to such employment make it important to establish a special service devoted to the subject of women in industry.

In view of the fact that the other services will, as above indicated, include within their sphere women as well as men, this special service of women in industry is not large; will be largely policy making and administrative in character rather than itself executive; but will maintain close contact with all the work of the Department on this special subject and will also coordinate and control such work in all other departments.

Stated more specifically the purpose of this service is:

1. To consider all general policies with respect to women in industry and to advise the Secretary of Labor as to the policies which should be pursued.
2. To keep informed of the work of the several divisions of the Department in so far as they relate to women in industry and to advise with the divisions on all such work.
3. To secure information on all matters relating to women in industry and to collate such information into useful form.
4. To establish useful connections with all governmental departments and divisions on this subject and with voluntary agencies and societies.

In announcing on July 9, 1918, the appointment of the director and assistant director, the Secretary further stated the purposes of the Woman in Industry Service as follows:

In recognition of the great importance to the Nation of the work of women in industry and the urgent necessity for a national policy in determining the conditions of their employment, I have urged and Congress has now granted, the necessary authority to establish a Women's Division in the Department of Labor. Its immediate task will be to develop in the industries of the country, policies and methods which will result in the most effective use of women's services in production for the war, while at the same time preventing their employment under injurious conditions. Its large and very necessary aim will be to focus attention on the national importance of the conditions of women's work as influencing industrial standards and as affecting the welfare of the entire Nation.

The Women's Division will be charged primarily with determining policies rather than carrying on detailed administration. Because of this policy-making function of the Women's Division, its director will serve as a member of the War Labor Policies Board. It will coordinate work for women in other divisions of the Department of Labor and in industrial service sections of other departments of the Federal Government. It will cooperate with State departments of labor, working with and through them, in order to bring about united action by the States in national problems of women's work. The Women's Division will concern itself primarily with war conditions but will be mindful of the need for observing and interpreting the tendencies in women's employment which are likely to have permanent social effects.

The Women's Division has been established in response to needs widely felt by all, men as well as women, who are conscious of the increasing share women must have in the industrial activities of the war. The problems of women in industry are so manifold and complex that a clearing house of thought and leadership is needed in the National Government. The Women's Division has been established to give this leadership.

Council on Women in Industry.—To accomplish the task of coordinating the efforts of all Federal agencies concerned in women's work the service was authorized by the Secretary of Labor to organize the Council on Women in Industry, composed of women representing every division of the Department of Labor and other Federal departments having organized work related to problems of women in industry. Its membership included the Women's Branch of the Ordnance Department, the Women's Section of the Railroad Administration, the Federal Board for Vocational Education, the Committee on Woman in Industry of the Advisory Commission, and the Woman's Committee of the Council of National Defense, and from the Department of Labor representatives of the services

concerned with investigation and inspection, training and dilution, information and education, and working conditions, the United States Employment Service, the Immigration Bureau, the Children's Bureau, the Bureau of Naturalization, the Bureau of Labor Statistics, the United States Housing Corporation, the War Labor Board, and the War Labor Policies Board. The council did not assume any executive or administrative functions nor did it have any authority over the programs of its members. It was a forum for discussion of the important questions coming before the Woman in Industry Service and the other groups cooperating with it. Among the subjects for discussion have been the safeguards to be established in new occupations, the enforcement of State labor laws, the regulation of night work under war conditions, the application of the principle of equal pay for equal work, and the recruiting and training of women workers. The cooperation which will be described in the succeeding report of activities of the Woman in Industry Service was materially furthered by the weekly meetings of the council.

Recruiting women for new occupations.—It has already been indicated that the outstanding question concerning women in industry which grew daily more important during the war was the necessity of greatly increasing the proportion of women in the essential industries of the country in order to meet the demands of production and at the same time to release men for military service. There was great danger of hysterical campaigns which would stimulate the recruiting of women without giving assurance that their services would become effective for production or that proper safeguards for women workers should be established. It was difficult for those unfamiliar with the difficulties of introducing a new and untrained personnel into industry to appreciate the care which must be taken to avoid actual decrease in production by rapid and careless methods of filling positions. Nor could those who had not been familiar with the efforts of years to build up standards for protection of the health of the workers appreciate how important were the maintenance and extension of those standards during the war. The situation was made more critical by the fact that companies whose policy toward their men workers had never won their confidences and cooperation were likely to arouse the suspicion that the war emergency would be used as an excuse for employing women at lower rates of pay and under conditions which would weaken any control gained by the workers through collective bargaining.

The following program was proposed by the Woman in Industry Service:

1. Standards governing the employment of women in industry should be authoritatively issued after adoption by the War Labor Policies Board, with the twofold purpose of controlling conditions especially in new occupations for women and also serving as a guide in the selection of occupations in which the employment of women might be increased. That is to say, instead of offering a list of occupations in which

women should be substituted for men, the Federal Government would promulgate standards, together with the statement that in any occupation in which these standards were upheld the extension of the employment of women would be desirable, at the same time calling attention to the necessity for greatly increasing the employment of women under these conditions.

2. Certain broad statements could be made about occupations in which it would be desirable to employ women, but these must always be in the nature of information rather than authoritative rulings, since local conditions would make a recommendation for the employment of women unwise in one locality and wise in another, where both the nature of the process and the conditions surrounding it were different.

3. Certain occupations which had been proved to be more injurious to women than to men should be listed as a group from which women should be excluded.

4. Instead of attempting to formulate a detailed program for the country as a whole, the War Industries Board and the United States Employment Service would be asked to name those localities in which the shortage of labor was most acute. The various Federal agencies concerned with investigation, training, placement, health, and working conditions would then be asked to concentrate their efforts in those localities in order to solve the problems there and also to give a foundation from experience for an increasingly adequate program of labor distribution throughout the country.

5. Inquiries into certain typical occupations should be pushed forward rapidly by the Woman in Industry Service with a view to making definite recommendation regarding changes in the process and the establishment of conditions which had been proved most effective in the experience of establishments employing women.

6. Meanwhile plans should be formulated for exhibits of women's work and other forms of educational presentation of facts which should result in enlisting the services of women in the war industries, while winning also the cooperation of industry in establishing the conditions which should make for the largest production over a long period.

It is possible to record progress in each section of this program, although the signing of the armistice made it unnecessary to introduce women in such large numbers in this country as in Great Britain or France, and the program as a whole was therefore not carried out. The action taken is set forth in subsequent pages of this report.

Standards governing the employment of women in industry.—A tentative draft of standards which should govern the employment of women in industry was presented to the Secretary of Labor October 10, 1918, adopted on October 18, and modified on October 25, in the light of the probability that an armistice would soon be signed. Before it was recommended to the Secretary of Labor it had been submitted for criticism and suggestions to every State department of labor, to representative employers, and to working women representing national and international trade-unions having women members. In formulating the standards consideration was given to experience in industry during the war, to regulations already established in State labor laws, and to such statements by Federal agencies during the war as General Orders No. 13 issued by the Chief of Ordnance and simultaneously by the Quartermaster General as recommendations to arsenal commanders and to manufacturers working on contracts for the War Department. The report of the National

War Labor Conference Board, which constituted the principles to guide industrial relations during the war, was also used as a basis.

It was decided by the production departments of the Government to insert in the contracts the most important provisions of those standards, especially those relating to daily and weekly hours of labor, and the principle of equal pay for equal work. With the signing of the armistice and the consequent curtailment of contracts this plan was not carried out. After some revision to meet peace conditions (consisting chiefly of the elimination of certain clauses permitting a working day as long as 10 hours when the necessities of war might require it), the standards were finally issued on December 12, 1918, as the basis for a program of reconstruction.¹

They were widely distributed through State departments of labor, and through organizations working to improve conditions of employment for women. The Employment Service brought them forcibly to the attention of all field offices. The interest which they aroused showed how widespread was the need for a statement of common purposes toward the attainment of which energies could be directed with assurance of support through united action.

Hazardous occupations.—Shortage of labor was first felt in those occupations in which working conditions were hazardous or disagreeable and there was serious danger, therefore, that women would be introduced first into occupations involving hazards to their health. To meet this problem a series of inquiries was planned, to discover the occupations in which women might be safely employed and the practical measures needed to remove all hazards not inherent in the essential nature of the process. To direct this work the Woman in Industry Service organized the committee on hazardous occupations, composed of representatives of the Surgeon General's office, the Ordnance Bureau, and the Chemical Warfare Service of the War Department; the Navy; the United States Public Health Service; the National Research Council; the Bureau of Standards of the Department of Commerce; the War Industries Board; the Working Conditions Service; the Bureau of Labor Statistics and the Woman in Industry Service of the Department of Labor.

The first place selected for a survey was Niagara Falls, where the chemical industries were of great importance as basic in the war industries. Two representatives of the Industrial Commission of New York State were added to the committee for this survey, to insure cooperation in putting into effect the detailed recommendations for dust removal, sanitation and safety, and other precautions against occupational hazards. These recommendations were worked out in practical detail by physicians, engineers, and women investigators acting for the committee.

¹A copy of the Standards will be found on pp. 142-143.

Certain general principles emerged from this survey. The first was that in some communities war conditions were merely accentuating labor shortage due not merely to the withdrawal of men for military service but to conditions of employment which were an obstacle in production before the war, less clearly recognized when workers were less free to choose.

The second fundamental principle was that unhealthful conditions were generally bad, not only for women but for men also. This, however, could not be held as an excuse for failure to correct those conditions before women should be introduced. For the sake of the productive efficiency of the industry employers should be discouraged from employing women until they were willing to apply the measures long known to be necessary as safeguards for health of men also in the hazardous occupations.

Although many industrial poisons are equally dangerous for women and men, lead poisoning, which is the most prevalent of them all, has for women and the race more disastrous consequences than for men. This is because lead is a race poison. The woman who has suffered from it is likely to be sterile, or to have miscarriages, or to lose her babies in the first year of life. These facts were emphasized by the investigation at Niagara Falls, which showed that a plant there manufacturing storage batteries had already employed women and might increase their numbers. In this occupation, and in this alone, did the Woman in Industry Service urge that no woman be employed anywhere or under any conditions in a process in which she would be exposed to lead poisoning. In all other forms of employment the Woman in Industry Service recommended not the exclusion of women but such changes in conditions as would make the occupation healthful for them. If practical difficulties stood in the way of these changes, it was held that the employment of women should be postponed as long as possible, under such conditions, for example, as exposure to dust or extremes of temperature, or the necessity for lifting or carrying heavy weights. In the industries of Niagara Falls so many changes would have been necessary that it was urged that women should not be employed in the chemical industries there until they should be made safe.

The general policy, however, was a recognition of the practicability of greatly decreasing the burdens of hand labor for men or women by using mechanical devices, and of affording safeguards against the risks of poisoning by removing fumes and dusts at their source, and by strengthening the individual's power of resistance through medical supervision, and through hours of work short enough to protect health.

The problem of night work.—The immediate reason for the investigation of the chemical industries was a request to the Department,

asking that the Federal Government should make it possible for the employers in war industries in Niagara Falls to disregard the New York State law, which prohibits the employment of women in factories at night. This was but one of many similar requests which came with increasing frequency during the summer and early autumn of 1918. Following the organization of the Woman in Industry Service all such appeals which reached the office of the Secretary of War were referred to the service for review. The Woman in Industry Service in turn considered these cases in cooperation with the various industrial-service sections of the other Federal departments, especially the Woman's Branch of the Ordnance Department, which made the initial investigation in the majority of plants making this request.

In the complicated problems which these instances illustrated there was presented the necessity for working out a program which should protect the health of the women at work and reenforce standards already set in the labor laws of the States and at the same time speed up production. No problem which the Woman in Industry Service was called upon to solve was more difficult than this. Before a wise program could be developed, it was necessary to study in the concrete case the importance of women's work in the production of the plant, to know the needs of the Government for that particular product, and to consult those organizations, especially those of the workers themselves, which had been responsible for legislation to protect women against night work in some of the most important manufacturing States.

Twelve States—Connecticut, Delaware, Indiana, Kansas, Massachusetts, Nebraska, New York, Oregon, Pennsylvania, South Carolina, Utah, and Wisconsin—had laws which prohibited the employment of women or girls, or both, in factories during the night hours. In two of these—Massachusetts by legislation creating a special board for the period of the war and Wisconsin through the regular powers of the Industrial Commission—it was possible to grant permits to plants making possible night work for limited periods. These laws applied to munitions plants. They had been enacted in time of peace and they expressed the opinion of the public in those States that night work for women was harmful because of its effects upon the health of women and their children, and because of its influence on family life. Moreover, experience had shown that night work was uneconomical for production, with less individual efficiency and greater cost for wages and supervision than by day. These considerations had led the representatives of 13 European nations, meeting in 1913 in Berne, to agree to eliminate night work for women in their manufacturing industries. In the war, however, this standard had been generally abandoned abroad. In England,

for example, where the employment of women at night work had long since been done away with, the increasing reliance upon the work of women in the manufacture of munitions had led to the general breaking down of this measure of protection.

At the very beginning of our participation in the war the Federal Government, through the Council of National Defense, had declared its policy of maintaining standards of employment during the war, and in particular those protecting the health of women and children. As these protective measures were for the most part contained in State rather than in Federal legislation, this declaration of policy took the form of an appeal to the States not to abandon or weaken the laws enacted for the protection of the workers, unless the Federal Government itself should find that the national war emergency demanded their modification. This, however, was to be a condition which the Federal Government alone should determine.

In applying this policy it was necessary to recognize that the differences between States gave rise to great inconsistencies. Thirty-six States had no legislation prohibiting night work for women. These included such important manufacturing States as New Jersey, Illinois, and Ohio, in all of which large quantities of munitions were manufactured on contract for the Federal Government. If the Federal Government recognized its responsibility for the conditions affecting the health of the women in munitions plants it could not ignore the fact that the employment of women at night in a factory in Illinois, where no law prevented, was as injurious as it would have been in a plant in New York, where night work had been eliminated by act of the legislature.

During the summer of 1918 the employment of women was rapidly extended, as the new draft resulted in the rapid withdrawal of men from the industries of the country. As a result of this increase in the proportions of women in the munitions industries their employment on night shifts became more general in States where no legislation prevented it, while in States having laws prohibiting night work the appeals of manufacturers, often indorsed vigorously by officers of the Ordnance Department, for modification of the enforcement of the law became more and more insistent. For the most part these were not requests from employers who were making the war an excuse to evade legislation enacted in the interest of the workers. Close study of them showed that they were evidence of the staggering load carried by the Ordnance Department in the necessity for greatly speeding up an already astounding program of production. The anxiety of Ordnance officers to eliminate every condition which seemed to them to hamper production in the slightest degree grew more and more tense. It looked very much as though the situation was developing to the point where the immediate need

for increased production in the most critical period of the war would undermine the standards established in time of peace to protect the health of working women.

To aid in developing a plan which would give due weight to all the apparently conflicting interests, the service called into conference representatives of the organizations most vitally interested in standards of working conditions established for the protection of working women. The whole plan, finally worked out after these conferences, was voted upon at a meeting of representatives of State labor departments called in Washington by the Department in October. Soon afterwards the conference of trade-union women called by the Woman in Industry Service also took action. Advice was also sought from the War Industries Board and representatives of employers were consulted.

At these conferences typical requests for permission to employ women at night were described. In one plant, for instance, which was probably more vital to the success of the ordnance program than any other single establishment, the chief reason for wishing to employ women on the night shift was a shortage of houses, which could not be remedied in less than three months, so that no large numbers of men could be added to the population of the town; but in the families of the men already living in the community were daughters, sisters, and wives who would be available to increase the working force. No two instances were exactly alike. The one fact common to them all was that the proposal to employ women at night could not be disconnected from the whole production and employment policy of the plant. In some cases the shortage of men for night work was due not to an actual shortage of labor in the community but to low rates of pay, or long hours on the night shift, or the absence of an efficient organization for employment management in the plant. Under such conditions it was not merely for the sake of the women workers that employment of women at night was to be discouraged. It was quite as necessary to discourage it for the sake of production, since in such a situation production could not be made satisfactory merely by night work of women. Satisfactory production required a thorough overhauling of the employment policy of the company which would result in a more effective use of the working force already available.

The conference revealed a very strong opinion that standards, in general, should not be lowered, and that, in particular, the practice of employing women at night should be vigorously discouraged. Overwhelming evidence from State departments of labor showed that the pressure against legislation prohibiting night work was becoming great, and that laws on this subject would be attacked at the coming sessions of State legislatures. It was feared that the attacks would be difficult to withstand because they would be made on the ground

of national necessity. Although there was diversity of opinion as to what should be done, it was generally agreed that it was only the National Government which could declare with authority whether or not the emergency was serious enough to require modification of standards which had commended themselves to the people of several States as necessary to protect the health of women at work.

The plan finally proposed was that the Federal Government should regulate and control night work for women in all plants working on war contracts for the Federal Government, through a provision in the contracts which would prohibit night work unless a special war emergency permit were granted. This plan provided that if it were demonstrated by the War Department or the Navy that it was necessary in a specified instance, in order to maintain adequate production to employ women between the hours of 10 p. m. and 6 a. m., the Secretary of War or the Secretary of the Navy, under conditions of employment approved by the Secretary of Labor, would send to the State agency charged with enforcement of labor laws a declaration that a national emergency existed in this particular instance and would call upon it to grant to a particular specified plant for a specified limited period a temporary war certificate. It was the opinion of legal advisers in the War Department and the Navy that in those States in which night work was prohibited by law these certificates would be valid under the war powers of the Federal Government. In those States having no laws against night work, the power of the Federal Government through its contracts was clear.

In connection with the administration of the proposed plan it was provided that thorough investigation should be made in each instance to determine the necessity for night work, and that each establishment to which a certificate might be granted should be under supervision, under conditions satisfactory to the Department of Labor. As showing the necessity for thorough investigation in advance it was pointed out that night work of women could often be avoided by the employment of men over the draft age and those not qualified for military service, by the transfer of men from nonessential industries, by the extension of plants, by the introduction of an industry into new areas, by a careful distribution of contracts with due regard to the local labor supply, or by the more effective use of the labor force of the plant through improved employment management. Certificates would not be granted unless it was clear that these methods had not sufficed to increase production to the point demanded for the prosecution of the war.

The plan in general was referred to the Secretary of Labor for action by the Council of National Defense. While this action was pending a conference of representatives of State departments of labor, called by the Department, was held in Washington. Following

a thorough discussion of the subject of night work, a resolution was adopted substantially as follows:

Resolved, That it is the sense of this meeting that we are opposed to the weakening of labor laws or labor standards, and if any temporary modification or suspension of such laws is necessary it should be made only on declaration of the Federal authority of competent jurisdiction.

A few days later a conference of women representing national and international trade-unions adopted a resolution to the effect that the standards and conditions regulating the employment of women at night should not be lowered.

The whole problem and the consideration given to it are recounted here because it had significance in revealing how complex is the relation between production and any phase of the conditions of employment, and how necessary it is to insist that conditions affecting the health of the workers shall not be lowered in the supposed interest of production. In the long run efficiency of management can make industry both productive and healthful for the workers. Experience points to the fact that production is made satisfactory through the delicate adjustment of many factors, in which high standards of labor are fundamental. The whole experience in dealing with the problem of night work revealed also the strength of public opinion against the employment of women at night. No state repealed a law against night work during the war.

State labor laws during the war.—While the subject of night work for women absorbed so much attention, especially in the last few months of the war, this was but one phase of the whole question of the enforcement of State labor laws in plants working on war contracts for the Federal Government and the necessity for co-operation between Federal and State agencies concerned in conditions of labor.

In several instances the jurisdiction of State officials was challenged in munitions plants, on the ground that the State did not have authority over Federal property. A decision of the Judge Advocate General of the Army on this subject caused some confusion in seeming to uphold this view, at least for certain types of contracts. To clear up the confusion the Department arranged to have inserted in all contracts a clause requiring full compliance with the labor laws of the State in which the goods are manufactured. Thus the observance of State labor legislation became a contract obligation of the manufacturer to the Federal Government, regardless of the jurisdiction of the State authorities in his plant.

Because of the great importance of State labor laws as measures of protection for women, the Woman in Industry Service gave a great deal of attention to this subject. Its director, acting as chairman of a special committee of the War Labor Policies Board, assisted

in formulating a plan of administration to render this clause of the contracts enforceable. Federal machinery for this purpose did not exist; and even if it had been available, the advantages of inspection and enforcement by State agencies seemed clear. It was more economical to use an administrative agency already equipped through past experience; it avoided duplication and left unimpaired the authority of the State officials when the war should end and when the jurisdiction of the Federal Government would again become relatively insignificant.

Wages and industrial relations.—The introduction of women into new occupations gave the question of their wages a new significance. If their employment in work hitherto done by men were made the occasion for reducing the rates previously paid for the same work, the men employed would naturally oppose the extension of woman's employment as a menace to the wage standards attained by the men, and the morale of industry would be affected by the resulting discontent. It was a realization of this danger which led to the first official indorsement by the Federal Government of the principle of "equal pay for equal work." The Chief of Ordnance included it in his recommendations to arsenal commanders and manufacturers and the Quartermaster General concurred when he issued the same recommendations simultaneously. Later the principle was made even more imperative through its inclusion in the statement of principles to govern industrial relations which was formulated by the National War Labor Conference Board.

It soon became evident, however, that the idea expressed in the usual phrase, "equal pay for equal work," was not comprehensive or fundamental enough to secure substantial justice for working women or to prevent the lowering of standards through the extension of their employment. The principle was inadequate, first, because it was not held to apply to those occupations in which the introduction of women required some change in process so that the work was not considered equal because it was not identical; second, the principle was insufficient because it failed to remedy fundamental defects in the usual basis for determining women's wages.

A thorough application of the principle of equal pay for equal work would seem to have required that wages should have been based on output and that they should have been set only after careful study of the actual effect of the new arrangement of work on the output of the group as a whole, rather than an arbitrary reduction to levels customarily regarded as the standard for women. It was by no means impossible to find instances where these new methods of doing the job had resulted in an increase in output when women did the work, and in these instances the injustice of a reduction in earnings was more clearly emphasized.

In formulating standards for the employment of women the service, therefore, made the following recommendation:

Women doing the same work as men shall receive the same wages, with such proportionate increases as the men are receiving in the same industry. Slight changes made in the process or in the arrangement of work should not be regarded as justifying a lower wage for a woman than for a man unless statistics of production show that the output for the job in question is less when women are employed than when men are employed. If a difference in output is demonstrated, the difference in the wage rate should be based upon the difference in production for the job as a whole and not determined arbitrarily.

Wages should be established on the basis of occupation and not on the basis of sex. The minimum wage rate should cover the cost of living for dependents and not merely for the individual.

The war proved the capacity of women for many more tasks than those previously open to them. The Woman in Industry Service held that the experience of the war was forcing a fresh examination of the basis for determining women's wages. If the principle of equal pay for equal work be accepted, it is impossible in logic or in justice not to push its application further and to accept the more fundamental conclusion that the wage value of a job is as great when a woman does it as when a man does it, and that the wage should be determined for the occupation and not for the sex of the worker. The Woman in Industry Service, therefore, formulated the following statement of the basis for determining wages:

Wages should be established on the basis of occupation and not on the basis of sex. The minimum wage rate should cover the cost of living for dependents and not merely for the individual.

That the experience of the war in England was forcing thoughtful observers to a similar searching for a fairer relation between men's and women's wages is shown in the report of the War Cabinet on Women in Industry, published in the spring of 1919. The main report follows traditional lines, but the minority report declares "that the essential principle which should govern all systems of remuneration * * * is that of the clearly defined occupational or standard rates * * *. There is no more reason for such occupational or standard rates being made to differ according to the workers' sex than according to their race, creed, height, or weight."¹

In the United States the formulation of these principles with reference to women's wages and the official indorsement of the policy of equal pay for equal work, limited and vague as it is, undoubtedly had a wholesome influence on public opinion, but unfortunately the authority and the machinery to enforce these principles was lacking.

From time to time the War Department and the Navy called on the Department for advice on wage problems for women producing war materials. State minimum wage commissions also sought advice

¹ Report of the War Cabinet Committee on Women in Industry, p. 254. London, 1919.

from the service and wage disputes affecting women were from time to time brought to its attention. The assistant director of the service was assigned to give special attention to the subject of wages and industrial relations. It proved to be a field fruitful in thought but exceedingly limited in the possibility of effective action, especially, as the majority of the women in the war industries were unorganized and hence without means of making their needs articulate. Undoubtedly, in the future, as the whole question of the wage basis in industry will demand searching inquiry, the relation between women's wages and men's wages must be thoroughly analyzed.

Training.—Closely related to wages is the necessity for giving women the same opportunity for technical and vocational training that men receive. The Woman in Industry Service was not charged with any special responsibility for a program of training for women workers. This subject is the permanent responsibility of the Federal Board for Vocational Education. For the temporary war needs of both men and women, the Training Service was organized in the Department of Labor. From time to time, however, the advice of the Woman in Industry Service was sought by employers, and conferences on this subject were held by representatives of the service with officers of the International Association of Machinists. The director of the service served as a member of the committee on the relation of military and industrial man power appointed by the War Labor Policies Board during the period when the committee was giving special attention to coordinating in a single program the efforts of the various Federal agencies directly interested in training workers.

Relations with employers and workers.—To assist in furthering the development of wiser policies in industry itself in dealing with women workers by furnishing training for employment managers, the director of the service served as a member of the employment management committee of the War Industries Board. The service also responded to requests from employers for advice by sending information or by making plant inspections. The tentative draft of the standards to be recommended by the service were submitted for comment to the executive officer of the National Industrial Conference Board and to an informal conference of representatives of employers and workers in the metal trades.

Reference has already been made to the conference of women representing national trade-unions which was called in Washington by the Woman in Industry Service to formulate a platform in the interest of women workers. This conference voted to become a permanent advisory council of working women. Through this council the service has been able to keep continuously in touch with the needs of the women employed in the largest industries and to have their advice in its plans and policies.

Public interest in women's work.—Before the armistice was signed, the service planned an educational campaign, chiefly through a traveling exhibit and lantern slides, which had the twofold purpose of recruiting the women needed to release men for military service, and at the same time showing the standards of employment necessary to make their work effective. It was hoped in this way to draw together various agencies, including women's clubs and other organizations which had planned recruiting campaigns. The signing of the armistice changed the immediate purpose of the exhibit, and it was finally developed with a change in emphasis to meet the altered conditions of the postwar period.

Lack of statistics concerning women in the war industries.—So many questions have been addressed to the Woman in Industry Service regarding the numbers of women in the war industries and the detailed statistics concerning them that it becomes necessary to point out that the appropriation of \$40,000 granted to the service would not have sufficed for so large a statistical inquiry. The service was not intended to be a statistical agency. Its activities in this matter were necessarily limited to making recommendations to the Bureau of Labor Statistics as to the type of information which seemed important to have collected at regular intervals. Through the Bureau of Labor Statistics and the War Industries Board a schedule of facts about labor conditions, including the employment of women, was prepared for use by the community labor boards organized by the United States Employment Service. Like so many other plans, the signing of the armistice found it uncompleted, and as a result we are without any comprehensive statistics of the part taken by women in industry during the war.

ACTIVITIES AFTER THE SIGNING OF THE ARMISTICE ON NOVEMBER 11.

After the armistice the Woman in Industry Service submitted a memorandum dealing with problems likely to arise for women in industry during the period of readjustment. Obviously the immediate task was the same on behalf of either men or women workers to accomplish the change from war to peace with the least possible unemployment and with the reinstatement of the largest possible number in occupations for which they were best adapted. The memorandum assumed that the fundamental aspects of the program as affecting both men and women were being worked out by the Department, especially a policy with reference to cancellation of contracts and demobilization of the Army which would take into consideration the effect on labor conditions. For women, however, this was not the whole problem, for the armistice marked a decided change in public opinion. The withdrawal of women from their work was advo-

cated as a means of providing employment for returning soldiers. However, women, like men, were working to earn a living and their continued employment was vital for them and for those dependent upon them.

The Woman in Industry Service urged that the permanent status of working women be recognized; that the Federal Government recommend definite standards for their employment in private industry, and that these standards be adopted in Government-owned plants; that a program of public education be pushed forward to secure the adoption of these standards as designed to promote the welfare of wage-earning women; and that as the power of the Federal Government to control working conditions through provisions in contracts would now be lessened with the curtailment of contracts, the Federal agencies should endeavor to stimulate those instrumentalities through which conditions would be determined, namely, State labor legislation, voluntary action of employers, action by working women themselves, and the continuing influence of public opinion.

Labor legislation.—For active cooperation between State and Federal departments of labor, the experience during the war afforded a precedent, and the Woman in Industry Service welcomed every opportunity to work with State departments or to assist local groups in their efforts to strengthen the labor laws in their State. In Indiana a survey was made at the request of the governor and the industrial board, the results of which were published in January. This was followed by a State-wide campaign organized by local committees, in which members of the staff of the service assisted. In connection with this campaign a conference of neighboring States was held which brought together in Indianapolis representatives of interested groups in Ohio, Kentucky, and Illinois.

Assistance was also given by the service in efforts to strengthen labor laws in Minnesota, Connecticut, Iowa, New York, Rhode Island, and Kansas, and the service was represented at the convention of the Association of Governmental Labor Officials in Madison, Wis., where the representative of the service presided at the session on women in industry.

Wages after the war.—It was the prevailing opinion that wages during the war had been so high that all workers were receiving enough to support themselves. This impression was based on statements of high wages paid in the munitions plants. It seemed important to verify this impression, and for this reason the Department responded to the request of private organizations in Philadelphia to investigate the wages paid to women in the candy trade there. Investigations before the war had indicated that a large number of the workers in the candy trade were receiving less than a living wage.

The investigation covered factories employing two-thirds of the workers in the candy industry in Philadelphia. It was found that wage rates had increased considerably since before the war, but the rapid increase in cost of living had resulted in largely nullifying the effect of these increased rates, so that a considerable proportion of the workers were receiving less than the amount considered necessary to meet the cost of living. A significant fact brought out in the investigation was that continuity of employment is even more important than a fair rate of wages. Frequent loss of time, whether due to lack of work or to personal causes, decreases production and curtails earning power.

The service cooperated with the Minimum Wage Commission of the District of Columbia, especially in its work of determining minimum rates for employees in mercantile establishments in the District, and in connection with Government-owned plants considerable attention was given to the subject of wages. The staff of the service was not sufficient to permit more extensive statistical studies along this line.

The Federal Government as an employer of women.—Although as has been pointed out, the power of the Federal Government to control conditions through its contracts decreased rapidly when war production no longer was necessary, it remained true that in its own plants, and through its departments employing women, the Government could set standards which would have an important influence on private industry.

At the request of the Secretary of the Navy, the Woman in Industry Service undertook to serve as an adviser to the Navy Department in matters affecting women employed in navy yards. Inspections were made and reports and recommendations submitted covering such subjects as readjustment of wage rates, better working conditions, organization of lunch rooms, and improved methods of employment management. Because the curtailment of work in the navy yards necessitated laying off numbers of workers, special attention was given to recommendations designed to prevent hardship by giving due notice before dismissal.

The service was also asked to cooperate with the Ordnance Department in matters relating to the employment of women in Government arsenals, and inspections similar to those made in the navy yards were in progress at the close of the period covered by this report.

The service also gave attention to questions affecting Government employees in Washington, especially in cooperation asked for by the Commission on Reclassification.

Negro women in industry.—By November the service found it opportune to consider the economic problems of Negro women. Accordingly an industrial agent was appointed and was sent out to survey several centers where typical conditions were known to prevail.

Within several months, the agent has investigated conditions among more than 16,000 Negro women employed in 156 plants located in the Middle West and in border-line States of the South in highly diversified industries. These industries may be grouped under five broad headings, viz, factory, hotel, department store, stockyard, and Government work. General standards for this class of workers were found to be somewhat lower than the average, and their industrial opportunities were found to be decidedly more restricted than those of other women. Remedial suggestions have been formulated and submitted to several agencies interested in the improvement of existing conditions—progressive employers, cooperating welfare organizations, and Government investigators.

Largely because of the abnormal situation obtaining under the war emergency, both conclusions and recommendations are necessarily tentative; but a survey involving reconstruction conditions is in progress.

Displacement of women workers.—A change in public opinion following the signing of the armistice has been indicated. A most significant illustration of difficulties faced by women workers was the situation in connection with the employment of women as conductors on the Cleveland street cars. The men objected to the employment of women and after the signing of the armistice asked for their dismissal. It is unnecessary to review the details of the involved case, which came before the War Labor Board. Although the board finally recommended that the women be retained, they were not reemployed.

The Woman in Industry Service had no official relation to this case, but because of its significance the director and assistant director, as individuals, filed a statement with the War Labor Board pointing out the desirability of freedom of choice of occupation for women in industry. In a somewhat similar case on the street railways of Detroit facts showing the home responsibilities of women workers were compiled by the service and filed by the attorney for the women at the hearing before the War Labor Board.

The dismissal of women from the street railways in Brooklyn was assumed to be due to the enactment of a law by the New York State Legislature prohibiting night work. The Woman in Industry Service offered its assistance to the Industrial Commission of New York State, and while the commission through its bureau of women in industry was making an investigation of the facts in Brooklyn, the service sent representatives to Chicago, Kansas City, Detroit, Boston, and Baltimore to get the facts about hours and working conditions for women employed on the street railways in those cities.

Allied to the whole subject of curtailment of opportunities for women workers was a brief survey of the status of women in the metal trades in Michigan. This inquiry showed that considerable numbers of

women had been laid off from Michigan plants, and that in some instances opportunities gained during the war were not likely to be permanent.

Home work in Bridgeport.—At the request of local groups an investigation of home work in the corset trade in Bridgeport was undertaken. It was found that a considerable amount of work was given out in the manufacture of garters, which is an industry allied to that of corset making, and that the work was carried on often in crowded, insanitary surroundings, and sometimes during the illness of members of the family suffering from infectious or contagious diseases; that a lower wage rate apparently was given than would be paid for similar work in a factory; that because of the absence of supervision production was likely to be unsatisfactory and earnings very low; and that child labor was utilized to the detriment of the welfare of children. Recommendations were made to the employers that the practice of giving out home work should be discontinued as soon as possible, and that in order to make this change with the least possible hardship for the workers, detailed plans be worked out at a conference representing employers, workers, and social organizations in the community.

Public interest.—Early in November the Department invited employers to submit photographs illustrating working conditions for women, and as a result of their generous response a collection of several hundred photographs are on file. These photographs and other material have been made the basis of a series of panels illustrating the standards recommended for the employment of women. Stereopticon slides have also been prepared. The material has been widely circulated among State departments, schools, colleges, labor organizations, and other groups interested in improving conditions.

The results of investigations made by the service have been printed in pamphlet form and, in addition, representatives of the service have taken part in conferences and assisted local groups in arousing public interest in the conditions of women's employment.

Permanent status for Women's Bureau.—Women in industry in 1910 constituted more than 21 per cent of the total number of persons gainfully employed in the United States. It is not only their importance in numbers but the special problems of their employment affecting industry on the one hand and family life and child welfare on the other which necessitates special provision by the Federal Government for a clearing house of policies and facts relating to their position in industry. The wisdom of Congress in designing such an agency as primarily policy making rather than itself executive seems to have been demonstrated in the actual experience of the Woman in Industry Service in securing cooperation and stimulating the activities of other agencies.

The problems of women following the war are likely to be more crucial than at any time during the past. The Woman in Industry Service has been continued by Congress through an appropriation enabling the Secretary of Labor to carry forward the investigations of women in industry during the fiscal year ending June 30, 1920. Because of the fundamental importance of the position of women in industry it is hoped that the Women's Bureau will be permanently established by legislation as a part of the Department of Labor, and that its resources will be enlarged in order to make possible more comprehensive work.

INVESTIGATION AND INSPECTION SERVICE.

Origin and functions.—The Investigation and Inspection Service was created under the War Labor Administration, with an appropriation of \$300,000, for the purpose of concentrating into one division and under one head the investigation work required by the various branches of the Department. The service was organized during the latter part of July, 1918.

The function of the Investigation and Inspection Service in the War Labor Administration was outlined as follows in a memorandum of the Secretary of Labor:

A force of investigators will also be needed for the various other services here contemplated.

In view of the fact that the service of an inspector, examiner, and investigator may often be combined in one man, especially at the beginning of the work, and also that the handling of a field force which travels from place to place is a large task in itself, I believe that the greatest economy and efficiency can be obtained by combining these field forces under the Secretary and with one inspector in charge, in a special service to be called the "Investigation and Inspection Service."

It will be my purpose to require all new services of the Department to use this Investigation and Inspection Service, so far as possible, in all their field work. For this purpose the inspector in charge of the service will provide, upon consultation with the other branches of the Department, methods of inspection, investigation, and examination, including blank forms for reports on the various necessary subjects, and will transmit such reports when made to the various branches to which they belong.

This service was organized with a view to making quick investigations of acute industrial situations and reporting the facts promptly to other divisions of the Department authorized to deal with such situations. A corps of about 50 investigators and inspectors was employed.

The Investigation and Inspection Service was authorized to make investigations and inspections only at the request of the other branches of the Department. Divisions of the Department which availed themselves of this service for part, if not all, of their investigating work were the Secretary's Office, Division of Conciliation, United States Employment Service, Division of Negro Economics, Bureau of Immigration, United States Training Service, Woman in Industry

Service, and Working Conditions Service. Through the medium of the Secretary's Office extensive investigations were also made for the War Industries Board and the Ordnance Department of the Army.

The War Industries Board, during the latter part of 1918, made extensive use of the Investigation and Inspection Service for the purpose of determining the facts and conditions obtaining in establishments holding Government contracts for the manufacture of war material, where delay in delivery under the contract was said to be due to adverse labor conditions. About 150 cases of this kind were investigated by the Investigation and Inspection Service. With information at hand as to the actual conditions causing the delay in the delivery of war material, the War Industries Board was enabled to take prompt action to correct the difficulty, and was in a position to know to what extent labor conditions as such were delaying manufacture. In many cases the very fact of the investigation was sufficient to bring about a readjustment by the concern involved; in other cases conditions were shown to be such that further contracts were denied.

The War Industries Board also asked for an investigation of the tin can manufacturing industry, to determine the most efficient methods of manufacture and to obtain data on the extent of wastage of material due to inefficient and antiquated methods. This investigation was an exhaustive one, embracing most of the tin can making establishments in the East and the Middle West. Although the War Industries Board was discontinued before the final report on this investigation could be made, the very valuable material contained in the report has been placed at the disposal of the United States Grain Corporation of the Food Administration for their guidance in the matter of placing contracts for food containers.

At the instance of the Bureau of Labor Statistics and the Bureau of Ordnance of the War Department, jointly, a survey was made of the chemical industry, which furnished a description of occupations in the industry and a study of the degree of skill and training required for each occupation.

A similar study was made for the Woman in Industry Service and the United States Training Service, jointly, of the piano industry. This survey was made to furnish data on the matter of "vestibule training," which is widely practiced in the industry; to determine how far piano workers could be adapted to and used in the manufacture of aeroplanes; and to obtain data relative to opportunities in the industry for women.

The United States Employment Service requested an extensive and detailed investigation of the powder plants at Jacksonville, Tenn., and Pompton Lakes, N. J., to determine the causes of the inordinately high labor turnover at Jacksonville and to secure

accurate information concerning the conditions of women's employment at Pompton Lakes. The two investigations were exhaustive, and as a result of the report of conditions at the two plants many of the objectionable features were corrected by the company.

An extensive industrial survey was made by the Investigation and Inspection Service for the Division of Negro Economics, showing the comparative labor turnover of Negro and white labor in war industries and also furnishing data relative to opportunities for colored workers, both men and women, in the industrial field.

One of the most important investigations conducted by the Investigation and Inspection Service gives the wages of seamen on American and foreign vessels sailing from American ports, showing the effect of the seamen's act on foreign vessels operating in American ports. This report has been printed as a Senate document.

The Investigation and Inspection Service undertook to prepare a list of available farm lands in eastern and southern States suitable for cultivation by returned soldiers. The survey was to furnish the acreage, condition, and exact location of unused available lands. This work failed of completion for lack of time, although the information desired was obtained in Georgia, North Carolina, and Virginia.

At the time of the organizing campaign conducted by the Amalgamated Association of Iron and Steel Workers to organize the steel-mill employees of the Pittsburgh and Johnstown districts, many complaints reached the Secretary's Office to the effect that municipal officials were using their offices and authority to interfere with organizing activities. This matter was turned over to the Investigation and Inspection Service to ascertain the facts, and an accurate and comprehensive report was made as to the extent of such interference. Later complaints that the steel companies were discharging all employees joining the union were investigated by the service. With evidence at hand showing that such a practice was being followed at the steel plants, the director of this service held a conference with officials of the Midvale Steel Co., of Johnstown, Pa., and secured from them a declaration that such practice was contrary to the policy of the company and would be stopped. Subsequently the superintendent of the Midvale Steel Co. severed his connection with the company, and the company fully recognized the right of its employees to organize.

The Investigation and Inspection Service has been of much value to the Division of Conciliation not only by furnishing accurate information for the use of the conciliators but frequently by averting through its investigations what might have become acute situations. Many cases of unfair discrimination against union members, cases of unjustifiable discharge, and of low wages have been investigated by the service and have been corrected, upon the establishment

of the facts without the need of a conciliator. An instance of the good results following the prompt action of the Investigation and Inspection Service in cases of threatened trouble was that of a condensed-milk concern in Utah, where a strike was imminent because of a very low wage scale. This concern was working on Government contracts. An agent of the Investigation and Inspection Service then in the West determined the facts as to the wage rate paid at the factory. The superintendent, while admitting the wages were too low, stated that they were controlled from the New York office and he had no authority to change them. This fact was reported by the agent. The matter was then taken up with company officials in New York, who promptly telegraphed authorization for a substantial increase in wages for the Utah plant. Many similar cases could be cited.

The activities of the Investigation and Inspection Service cover a very wide field. One investigation of importance dealt with wages and conditions of women home workers working on Government contracts for tobacco and parachutes in Lancaster, Pa. Another established the facts relative to the recent strike of Chinese waiters in New York City. A survey was made of the fur-manufacturing industry, to determine the prospects for expansion and for the establishment of apprenticeship training looking toward greater skill. Many cases of failure to comply with Government standards of wages and hours on Government contracts have been investigated and adjusted. An inspection which disclosed seriously objectionable sanitary conditions in a shipbuilding plant resulted in material improvements.

At the time of its dissolution the Investigation and Inspection Service was engaged in an investigation of the extent of probable emigration of aliens to their home countries. So far as conducted this investigation embraced the meat and food packing centers of Chicago and vicinity; the Indiana, Ohio, and Pennsylvania steel-mill districts; the Pennsylvania coal-mining area; New England manufacturing centers; Greater New York and vicinity; and other centers of large alien population. Figures and estimates were obtained of the prospective emigration of aliens, by nationalities. This work was necessarily curtailed because of the brief time at the disposal of the service and was incomplete when the service was discontinued. However, sufficient data were secured to afford a basis for computation of the extent to which industry will be affected by alien emigration.

The Investigation and Inspection Service was a highly important adjunct to the Secretary's Office because of its ability to obtain facts and ascertain conditions immediately, when such facts were needed. The prompt investigations of legitimate complaints on

the part of the workers did much to foster the spirit of cooperation and confidence between the Department and the workers. The specific instances cited are only the most important of the many cases handled by this service.

The Investigation and Inspection Service was discontinued on June 30, 1919, returning an unexpended balance of approximately half its original appropriation.

UNITED STATES TRAINING SERVICE.

As originally instituted this service was known as the Training and Dilution Service, but with the signing of the armistice the need for dilution of skilled labor ceased and the name of the organization was changed to United States Training Service.

Origin and functions.—The act establishing a War Labor Administration carried an appropriation of \$150,000, "to enable the Secretary of Labor, during the present emergency, to carry on the work of war labor administration * * * the training and dilution of labor * * * Training and Dilution Service, \$150,000." In the memorandum of the President directing the Secretary of Labor to form a war labor administration appeared among other instructions that of creating an agency to furnish—

a satisfactory method and administration for training of workers; an agency for dilution of skilled labor as and when needed.

The Secretary of Labor outlined the purposes of the service in a letter as follows:

In connection with the work of the Secretary of Labor in promoting and developing the welfare of the wage earners of the United States by advancing their opportunities for profitable employment, it is frequently necessary to consider the matter of assistance to wage earners by the promotion of the best shop methods for their training. In this connection it is not the purpose of the Department to enter in any sense into the educational field either in its general aspects or in the special matter of vocational education. The Secretary is a member of the Federal Board for Vocational Education and intends in no way to duplicate its work.

But the work here proposed is or may become of vital importance, especially in the industries most essential to the war. Already training facilities for workers are being found necessary and are being provided for shipyards under the Emergency Fleet Corporation. The need in other lines is not quite so clear, but indications are sufficient to show that provisions must now be made for such a service.

A service of this sort requires the employment of experts who are familiar with the best methods now being used for shop training, and the promotion of the use of such methods by information carried to the employers and wage earners.

The Training and Dilution Service was instituted July 16, 1918, and Charles T. Clayton, theretofore assistant director general of the United States Employment Service, was appointed director.

The first problem of this new service was to discover the best methods used in various plants for training persons to do skilled

and semi-skilled work; to ascertain the industries and particular plants needing larger supplies of trained workers than could be found through the efforts of the United States Employment Service; to determine the special types of employment in which training appeared to be most needed to meet the existing war emergency; and to organize and promote the adoption by employers of the most practical and useful methods of training.

Organization.—Four principal divisions were established within the service as follows:

I. Planning Division: (1) Training Methods Section, in charge of studies of existing training methods in the United States and elsewhere, preparation of plans for instituting and carrying on training in industries and for improving training where being conducted, coordination of methods with the work of the Federal Board for Vocational Education, and uniting all training activities into a comprehensive educational scheme for all industries; (2) Research Section, in charge of collection and analysis of written and printed reports of training for the use of the service; and (3) Information Section, in charge of preparation of bulletins, reports and news articles for publication, and information regarding the work of the service for the use of employers and employees. In this section all editorial work on pamphlets and bulletins was done in collaboration with the Research and Training Methods Sections.

II. Administrative Division: (1) Personnel and Accounts Section, to keep all records of personnel and all accounts of expenditures and allotments; (2) Statistics and Reports Section, to record all operations in the field and prepare tabulated analyses of industrial conditions for the information of the service; and (3) Correspondence and Files Section.

III. Training Division: To supervise the field service by districts as follows: (1) Maine, New Hampshire, Vermont, Rhode Island, and eastern Massachusetts; (2) Connecticut and western Massachusetts; (3) northern New York; (4) southern New York and northern New Jersey; (5) eastern Pennsylvania and southern New Jersey; (6) southwestern Pennsylvania, West Virginia, and Jefferson and Belmont Counties in Ohio; (7) Maryland, Virginia, North Carolina, and South Carolina; (8) southern Indiana, southern Ohio, Tennessee, Louisiana, Mississippi, Alabama, Georgia, and Florida; (9) Michigan; (10) northern Indiana, northern Illinois, Iowa, Wisconsin, Minnesota, North and South Dakota, and Montana; (11) southern Illinois, Missouri, Arkansas, Texas, Oklahoma, Kansas, Nebraska, Wyoming, Colorado, New Mexico, Arizona, Utah, Idaho, Nevada, California, Oregon, and Washington; and (12) northern Ohio, and Mercer, Crawford and Erie Counties in Pennsylvania.

IV. Dilution Division: To undertake surveys of the war industries, to determine occupations within such industries where the available supply of skilled workers was so limited as to necessitate introduction of less skilled workers, and to promote skilled workers already in such employments to supplement the diminished labor supply to meet war needs. The division had been organized and was about to start its work when on November 11, 1918, the signing of the armistice rendered further operations of the division unnecessary.

Activities of the service.—Before the Training and Dilution Service was established the labor committee of the Advisory Council to the Council of National Defense had set up a voluntary subcommittee to promote interest in industrial training. This committee had carried on a great deal of promotion work, and upon organization of the regular governmental agency, the head of that subcommittee was appointed chief of the Training Division and sent out to find competent men to act as field superintendents of training. The field districts were established on identical territorial lines with those selected by the Ordnance Division of the War Department and the field superintendents were by courtesy of the Ordnance district chiefs provided with quarters in nearly every district, with the added advantage that the daily reports of Ordnance inspectors greatly simplified the problems of finding those war industries and plants most in need of training assistance. Due largely to the assistance of the Ordnance, Engineers, Signal Corps, and other field organizations of the War Department it was possible for the Training and Dilution Service in the few months of its existence before hostilities ceased to secure the training of about a half million industrial workers in the war industries.

An example of effective cooperation between the Ordnance officials of the War Department and the Training Service of the Department of Labor was the work in the Philadelphia district. The Ordnance chief of that district early appreciated the value of industrial training in increasing production and offered assistance to the Training Service then being organized. One of the most experienced training men of America was dispatched to Philadelphia and installed in the Ordnance offices. The district chief of Ordnance assigned five men from his forces to work under the training superintendent, and an intensive survey was made of the whole district, both plant and public-school facilities for training. Fifty-two plants were shortly got into line for various types of training and plant training departments actually instituted in a considerable number of them within the few months preceding the armistice. At the same time 17 large schools and colleges in the same territory were surveyed, stock taken of their equipment suited for mechanical-training purposes, and ar-

rangements nearly completed to launch a comprehensive program under which young people could commence apprenticeship courses in a half dozen vitally important war industries, through joint leadership of the United States Training Service, the Ordnance Department, and the Philadelphia public-school authorities. The ending of hostilities, however, obviated the necessity for such extensive action.

The methods of the field service were as simple as the philosophy of industrial training, comprising visits to employers found to be in need of higher average output, explanation of industrial training, analysis of the plant, preparation of plans for setting up training adapted to the special local needs, and assistance to the employer in selecting from his own personnel those fitted to do the training. After the training school had been set up, the superintendent of training visited the plant at intervals, watching the work of the instructors, suggesting improvements, and reporting the progress of training both to the employer and to the director at Washington. The Training Methods Section at Washington, assisted by these reports and the data compiled by the Research Section, worked out plans for more expeditious or more thorough training, which from time to time were sent to all field superintendents and to established training schools conducted by employers.

Because of the lack of organized methods and of trained persons capable of teaching more than from any pronounced objection upon the part of employers, in most plants the training given was quite limited, frequently going no further than teaching new employees a simple process or short sequence of processes. As time passed, however, it became evident that more thorough and comprehensive training offered advantages to both employers and workers, and when hostilities ended many plants were establishing elaborate schemes for training, involving progressive steps from a few days for simple processes to three-year courses for apprentices, including mathematics, design, stresses and weights of materials, and other elements making up a thorough training in the crafts taught. One of the first bulletins issued by the service described these courses as prepared by a large manufacturing plant at Utica, N. Y., where 10,000 square feet of floor space was set apart for training new employees upon a variety of operations, including milling, grinding, profiling, drilling, screw machine operating, inspecting, assembling, general bench working, special and automatic machine operating, barrel making, and lathe turning. At first employees were taught a single operation, but later were given an opportunity to return for training on additional machines, and a program was evolved covering 48 working days, utilizing the facilities of the plant's five tool-making departments, in addition to the training-department space, to give a very intensive

course to promising employees upon special operations. With this course lectures, use of three excellent textbooks, and a night course in mathematics, mechanical drawing, and blue-print reading and interpretation were also given. A third division of the training program took up training of machine and tool adjusters, the pupils being men already experienced in production work. This course led to foremanships.

In another very large plant in Indiana experience with the training department brought about the practice of hiring no employee until he had shown by a test in the training room that he actually did know the work for which employed, and courses covering every phase of work in the factory were outlined and put into practice. This school is still in full operation.

With the termination of active hostilities, 147 training departments were in full operation in war industries, including some of the largest industrial establishments in America. Training ranged from several months to only a day or two, but was steadily being lengthened and improved, the standards being raised and the requirements made more rigid. Immediately after November 11 many war contracts were canceled, and extensive reductions of labor forces began. For a time it seemed that all training departments would be closed, but shortly afterwards it was found that the value of systematic training had only begun to be realized. The assistant director of the Training Service, with the aid of a splendid corps of zealous workers, conducted constructively suggestive scientific analyses of the industrial situation. It became clear that the greatest service of the Department to industrial training lay less in promotion of plant training schools than in the development of sound methods which employers themselves might institute.

Although the dilution work was discontinued, the field service was retained but used principally to gather information for the Planning Division, acting in an advisory way to such employers as desired assistance in setting up training departments but emphasizing the study of existing training and development of improved methods.

After several conferences and preliminary study of various industries, some of war and some of nonwar type, it was determined that during the remainder of the fiscal year the United States Training Service should work entirely upon the preparation of sound methods for use of employers in plant training departments to be published in pamphlet form, except for the maintenance of a smaller field force of competent plant advisers to care for requests from employers for assistance.

Accordingly assignments were made of experts in the fields of shoe and rubber manufacture, foremanship practice, general training methods, foundry practice, garment making, textile methods, piano

manufacture, lithography, and paper-box making. These experts were instructed to proceed to the localities in which were representative plants engaged in their respective specialities, to assemble staffs of competent men, and in the light of their own experience as trainers to construct plans for adequate training of employees for each such industry, the plans to consider (a) training of existing labor forces for higher efficiency and wider knowledge of their employments, (b) training of new labor, and (c) training of experienced workers to be foremen.

Through the hearty cooperation of employers' associations and individual employers, large staffs of technically qualified men, frequently of a type no money compensation could have interested, were assembled; and these men worked literally night and day to adequately cover their important tasks. From early in January until the 30th of June these staffs were engaged in following working processes, checking up their data, comparing results, and slowly evolving material of great practical value to the industries studied.

The following bulletins were completed during the fiscal year, although some of them did not issue from the printing office until after the end of the period.

Bulletin
No.

1. How to start a training department in a factory.
2. A successful apprentice toolmakers' school.
3. British methods of training workers in war industries.
4. Training employees for better production.
5. Training labor for peace time.
6. Labor turnover and industrial training.
7. Industrial training and foreign trade.
8. Some advantages of industrial training.
9. Seven million candidates for training.
10. A business man's experience with industrial training.
11. Efficient training in a large plant.
12. How training departments have bettered production.
13. Industrial training in representative industries.
14. Training in industrial plants.
15. Paper-box manufacturing.
16. Training in the men's suit and overcoat industry.
17. Training workers in the women's cloak and skirt industry.
18. Industrial training in the overall industry.
19. Training for shirt makers.
20. Training in the rubber industry.
21. Training in the shoe industry.
22. Courses of instruction in piano making.
23. Outline courses for instruction in lithography and photolithography.
24. Foundry training methods.
25. Courses of instruction for workers in cotton mills.
26. Foremanship training courses.

If time had permitted, similar studies in several other industries could have been completed, but it was found impossible to prepare for publication within the limited period any more of the wealth of material at hand. More than 20 important industries were on the lists of the service, requesting studies to be made and courses prepared for their use, when the appropriations for the service were discontinued.

Meantime, employers in those industries that were being studied were becoming greatly interested, as is shown by the following table of training reported to the service in the week before operations ceased:

Table showing the status of training in industrial plants on June 30, 1919.

District.	Companies with training departments in existence June 30, 1919.	Training departments discontinued.	Establishments interested in training June 30.	
			Interested, asking advice.	Preparing to install training.
1.....	26	7	8	7
2.....	35	7	13	5
3.....	109	6	73	12

11.....	13	1	1	3
12.....	16	1	6	16
Total.....	359	67	247	125

With 359 training departments in existence and only 67 departments discontinued within six months after the close of hostilities, evidently industrial training is found by the industries themselves to be of practical value for peace-time service. The further fact that on June 30, 247 establishments were reported asking for advice and contemplating instituting training departments and 125 other establishments were preparing to install such departments, many of them held up because the Training Service could not assign them the advice of one of its officers, the growing interest of the industries is manifest.

Much of this interest is due to the work of the chief of training. After the service undertook as its principal aim the preparation of training methods, he devoted his time to attending meetings of employers, in conventions and associations, and there explained to them the purposes of the service and the possibilities of training as a means of interesting their employees in developing themselves. Hundreds of employers were thus induced to look into the subject and they requested advice and assistance. But almost an equal factor was the interest of competitors. Employers began to find that where

a rival had a good training department a better class of employees sought his employment for the wider opportunities afforded them; that better grades of work were turned out and better wages earned, with consequent decreased turnover and cheaper production even on higher wage scales. Whereupon they also asked for advice, and from this source increasing interest was being shown during the latter months of the service.

The greatest value of such a service as this, however, lies in the preparation of methods and the conduct of a clearing house of information for industries. Industrial training is pedagogic, but it is also experimental. The methods of the pedagogue, as traditionally employed, fail conspicuously. Teachers of the school type rarely succeed in a training department. They do not understand the necessities of the factory, which require a kind of discipline, both mental and physical, different from that of the school. The standards of factory production differ radically, both in kind and degree. In schools the "passing mark" of 65 to 75 per cent satisfies. In industry nothing will do but 100 per cent quality in any well-organized establishment. Product falling below the top grade is either "seconds" or rejected. Workers must produce "firsts" habitually or they can not be retained. In the industrial school perfect product must be coupled with adequate output to pay costs of operation, and the school being really a miniature factory run with factory methods, rather than a laboratory, production must be on a production basis. These two fundamental elements—perfection of product and sufficiency of output—are not included in the instruction of the schoolmaster, so that in setting up training departments the service found it necessary to seek instructors from the ranks of workers rather than from other sources. Employers and workers both realize this, and when training of a practical type is provided employees seek it with enthusiasm. In many plants where comprehensive training schemes were adopted, waiting lists of applicants for opportunities to take courses became an immediate necessity.

The tendency to improve quality of training was very manifest also. The action of the National Foundrymen's Association is significant. When this body was asked for assistance in studying the foundry industry, the reply of its leaders was "we will gladly do anything we can, if the purpose is to provide methods for thorough training of workers who shall know all the minutiae of their employment." Similar expressions from leaders in a dozen other lines showed that many thoughtful employers are being led to realize that workers can not profitably be employed on a single process as a general rule; that the method of production by specialists is useful only to a degree, not as a plan for the entire staff of an industry or even a single factory. Indeed, analyses of several large factories

known as "production organized" brought out the unexpected discovery that even in such establishments a large proportion of employees are all-round workers, and necessarily must be so qualified. To maintain the percentage of such workers practical training must be provided in the plants. The schools can not meet the need.

The vital necessity for a system of industrial training has been proved by the experience of the United States Training Service. The required elements are (1) a clearing house of methods and experience; (2) a corps of adequately trained experts to study special conditions, industry by industry, and to prepare from time to time up-to-date and sound methods which industries themselves may apply in their establishments; and (3) regular periodic gatherings of leading employers and leaders of employees, at which the broader aspects of the subject of industrial training may be discussed and the Government advised as to the improvement of industrial education in the interest of the employee, employer, and the public.

The experience of the service indicates that out of the 10,000,000 wage earners now employed in American factories, probably three-fourths are not properly qualified for their chosen occupations. This great body of seven and a half million workers to-day has no recourse for education suited to its needs. With workers stumbling along from day to day, oppressed with a sense of inferiority and hampered in ability to produce the goods the Nation needs and to earn the wages they must have to live, industrial unrest is not surprising. It is the duty as well as the privilege of the Nation to meet the need for industrial education by showing employers how to establish adequate training schools for their workers. No single remedy can be found for industrial unrest; its causes are complex. But no element in its causes is larger or more important than the feeling of denied opportunity that oppresses the worker who knows that his knowledge of his work is insufficient, and who charges that denial upon a society that ignores his situation and will not give him even advice and suggestions.

The sum of the findings of the United States Training Service is that labor wants an open way to self-development, a real opportunity for self-advancement, and that through a system of practical industrial training, intensive but thorough, lies more of such opportunity than in any of the present accepted types of education

INFORMATION AND EDUCATION SERVICE.

Origin and functions.—The Information and Education Service was created as a part of the War Labor Administration and was provided for through an appropriation of \$225,000 in the act making appropriations for sundry civil expenses for the fiscal year 1918.

The service itself was organized July 1, 1918. Its function was to disseminate information among employers and wage earners concerning the work performed by the various branches of the Department of Labor and to stimulate such morale among workers and employers as was necessary to increase production. This work was performed in various ways—through the press, public speakers, motion pictures, and posters.

The title of this service does not wholly describe its work. Strictly interpreted, the title would have included the functions of the Bureau of Labor Statistics also, for the work of that body is almost wholly educational and informative. The investigations of the Bureau of Labor Statistics are, however, largely fixed; in large part they are of a statistical, historical, or scientific nature. The work of the Bureau of Labor Statistics is of a permanent character and is carried on without regard to either war or peace. Through the Information and Education Service on the other hand it was proposed to handle the publication of matters of an informational and educational nature, such as that especially needed in the war emergency. Such diffusion of information could not have been obtained through the machinery of the Bureau of Labor Statistics nor through any extension of that machinery. It was necessary, therefore, to create a separate service for that purpose. While the functions of this service were not confined within extremely narrow limits, it had in view, nevertheless, the more immediate purpose of promoting sound sentiment in industrial plants or combating unsound industrial philosophies and the acquainting of the public with the national war labor program of the Government.

Organization.—For the purpose of subdividing the work of this organization five divisions were created. They are as follows:

1. Educational Division.
2. Information Division.
3. Economics Division.
4. Poster Division.
5. Industrial Plants Division.

Later there was added still a sixth division, during the period of reconstruction, known as the Division of Public Works and Construction Development.

The work performed by the Information and Education Service falls, as in the case of the other branches of the Department, into two periods—that included during the war and that period extending from the signing of the armistice to the end of the fiscal year.

WAR PERIOD.

Educational Division.—The purpose of the Educational Division was to assemble the news of the Department of Labor and to bring it to the attention of the public through a central agency. It was commonly known as the Publicity Division since its chief relations were with newspapers, magazines, and periodicals. The news as brought to the attention of the press had to do with labor and its allied topics, the cost of living, wages, working conditions, activities of trade-unions, etc. Its main purpose was to strengthen by the written word the morale of both worker and employer. In carrying out this purpose, however, no articles were prepared with a view to sending out propaganda on particular subjects or to give labor news a partisan or a prejudiced presentation. It acted wholly upon the theory that the morale could best be stimulated by making the truth available to all the people of the United States. Acting upon this theory it cooperated with the public press at all times so as to make accessible any information with regard to the war labor program of the Government. In carrying out this work the Educational Division formed interdivisional contacts with all the bureaus of the Department of Labor and interdepartmental contacts with all the other executive departments of the Government. Through these contacts it obtained much information of value to wage earners which would not otherwise have been disclosed and made available for public use many valuable economic reports which would otherwise have been made known only to a limited audience. A clipping service was established which covered most of the newspapers and magazines in the country.

Method of distribution.—Both telegraph and mail were used. In conducting its telegraph service this division received hearty cooperation from the principal war operations in distributing information to the newspapers not only of the United States but of foreign countries. Much cooperation was also received from the commercial organizations which sent material to regular clients in what is known to the trade as "boiler plate." Magazines were reached through the staff and special writers. The facilities of the division, however, were placed at the disposal of all such persons as were genuinely interested in securing information for magazine articles and stories. In addition many other special channels were used. Among these such institutions and organizations as the Carnegie Institute, the Military Intelligence, the Council of National Defense, Committee on Public Information, the American Educational Association, the Federal Board for Vocational Education, the Signal Corps of the War Department, Red Cross, etc.

Extent of distribution.—It is difficult to state exactly what circulation any particular item may attain. The method adopted by this

division for estimating the extent to which material was disseminated was an absorption check through clippings. The clipping service maintained by the division covered 150 papers, with a daily circulation ranging from 20,000 to 400,000, in cities ranging in population from 32,000 to 5,000,000. Based upon these figures an average circulation of approximately 12,000,000 readers per day was attained.

Information Division.—The Information Division was created to give effect to that portion of the President's memorandum of January 3, 1918, which provided for "the function of developing sound public sentiment." The basic thought back of this division is well stated in the words of the chairman of the War Labor Policies Board: "Production is vital to the winning of the present battle and for the winning of the war uninterrupted maximum production. Production means supplies for the fighting forces and production is wholly dependent upon labor. There may not be an adequate labor supply wisely distributed to meet the needs of the war industries; there must be sound and just conditions under which labor is employed." To bring home this statement to patriotic citizens generally and to employers in particular was the task assigned to the Public Speakers' Section. The tremendous turnover of labor supply added to the abuses occurring out of competing employment agencies as well as to the unwholesome and inadequate living conditions surrounding wage earners and their families in many of the large industries made it essential to increase the production, as well as in justice to the employees that the Government should do everything possible to better conditions. It was especially intended that employers should be made to realize their responsibilities along these lines. Consequently a small but efficient force of staff speakers was organized. In the period from July to December they made 378 addresses in 41 States. At least 100,000 representative business men heard their message. In addition the division secured capable volunteer speakers to the number of 400. They were constantly supplied with material as to policies and facts and were urged to seek in their home communities every suitable opportunity to encourage right relations in industry. Reports from 50 of these volunteers show they made more than 1,200 addresses. The general tenor of the messages delivered was as follows:

Maximum efficiency means no jumping from job to job, no idleness, no desultory work; but constant, determined, efficient effort every minute until the war is over. Every shift of a worker is a loss of efficiency that can never be regained. Investigate causes for shifting. Save man power over here.

The strain of the war must be borne by industry as well as by the soldiers in the Army. With 2,000,000 men overseas we must not only make up for their lost labor, but we must increase our prewar output. We must produce faster than war destroys. Chaos in the employment field must be replaced by system and efficiency. The

United States Employment Service has been created to replace competition with cooperation. The waste of labor turnover must be eliminated.

The Government will not allow the unpatriotic worker or unpatriotic employer to block necessary output. Workers and employers alike are assured a square deal when they apply to the Taft-Walsh Board. Let the War Labor Board decide the differences. In the meantime keep on showing the boys we are with them.

The "slacker" in industry, the firm which poaches on your help, the employer who offers alluring inducements to entice away employees will not be tolerated. The Employment Service will be glad to assist the employer in getting necessary workers, but he must not trespass on equal rights of other industries. Failure to heed requests from the War Labor Board will bring down upon the offending employer the condemnation of America.

The employer must realize as a leader in the Nation's industrial army that he and his workers are partners in the struggle for democracy and liberty. This cooperation must extend on the part of the employer to his working in close understanding with the United States Employment Service. To safeguard the rights of workers, employers must understand such basic labor policies as the eight-hour day in war industry; that for the sake of our industrial and economic future child-labor legislation must be upheld for the protection of our Nation and the workers of to-morrow; that where the necessities of our essential industries draw women into places left vacant by the men entering our ever-expanding Army the jobs must be suited to the women. Health and sanitary conditions must be made fit. Where jobs are by their very nature unsuited for women, women must neither be called upon nor allowed to volunteer. Where work is too heavy, machinery must simplify it. The guarding of these principles was committed to the Woman in Industry Service, while the Information Division spread the message.

There must be a new vision in industry. The dollar vision must disappear. Not what we have got but what we have done is what the public will demand of us. Our work must be our patriotic offering. The worker must feel not that he is merely enriching his boss, but that he is a real fighter in the cause of democracy. The road to victory lies through every citizen being determined that our Army must be fed the best and have the best guns. Money alone won't produce these things, but work will.

All engagements were made and details arranged by the Washington headquarters. Schedules were arranged for a number of speakers who undertook tours reaching every State in the Union. Staff representatives for the field were constantly kept informed through bulletins and correspondence.

Conference of speakers.—Responding to a call issued by the director of the division there was organized early in the fiscal year an inter-departmental conference of the different agencies of the Government using the spoken word as a means to increase morale and stimulating production of war material. Some eleven agencies of the Government were regularly represented at weekly conferences. The avowed objects of these weekly meetings were such matters as medial assistance in the exchange or borrowing of speakers, response to emergency calls or medial assistance where specialists were needed for concerted campaigns, exchange of information as to field conditions or reports upon sentiment in particular localities, cooperation in the regulation of policies of speakers, and advice to each other as to different schedules in order to avoid duplication or oversaturation in any one section

or district. This conference met regularly and was continued throughout the war. It was doubtless of great value in standardizing and correlating speakers' activities.

Motion pictures.—In furthering the policies laid down, early advantage was taken of the popularity of motion picture films to interest and instruct the public generally in industrial and labor policies so vital to increase war production. This work was conducted in cooperation with the Committee on Public Information and with the principal motion picture companies. The latter cooperated heartily in developing special films illustrative of the various war needs. One of the first produced was a film directing attention to the necessity for farm labor. Two films were sent out each week which dealt with news alone and many special feature pictures were developed for various bureaus of the Department of Labor, including one for the Bureau of Naturalization, which was part of a campaign in the public schools for Americanization. This section also served as a coordinating agency through the formal weekly conference in which were included representatives of nearly all Government departments utilizing films as a means of publicity or propaganda.

Industrial Plants Division.—The Industrial Plants Division was created July 25, 1918. Its function was to carry the message of the Information and Education Service to the workers in the industrial plants themselves by way of supplementing the work being done by the other divisions through the intricate mediums of the spoken word and the printed page. Its plan of organization contemplated functioning through war industries committees in individual shops or plants. Such of these committees as were formed consisted of five representatives of the employees and one representative of the employer. The function of the committee was to supervise patriotic work in the plants. They were not permitted, however, to assume under the pretext of war necessities any functions which were normally carried on by other committees or representatives either of workers or employers which had to do with the industrial relations between worker and employer and the working conditions of wage earners. Special attention was devoted by this division to the maintenance of production through the elimination of the personal causes of inefficiency. Absenteeism or unnecessary tardiness which tended to disorganize or retard production were in particular discouraged, as were also unprofitable shifting from one plant to another so as to create an unnecessary labor turnover and retardation of production as an economic weapon.

Through the committees above mentioned contacts were established directly with hundreds of thousands of workers. Weekly letters were written to each committee chairman keeping him informed as to the

progress of governmental work and advising him as to special governmental necessities. Particular emphasis was placed on the necessity for industrial peace and cooperating particularly with the Industrial Labor Service of the Department. Through the contacts hasty action on the part of the workers was frequently eliminated and grievances between them and their employers referred to the Labor Adjustment Service for such assistance as it was able to render or to the War Labor Board for final adjudication when conciliatory methods failed.

Division of Economies.—The work of this division was largely of an advisory character. It was particularly concerned with the labor policy of the several departments of the Government and with the assembling of information for the advice and assistance of the other divisions of the service. No attempt was made to build up or develop an independent division for administrative work. The division secured information concerning the policies set forth for the various bureaus of the Department of Labor, the purport of the decisions of the War Labor Board, the labor adjustments of the Shipping Board, the Quartermaster Division of the War Department, and like agencies involving industrial relationships. Memorandums summarizing these decisions and policies were prepared for the use of the other divisions of the service; in particular a typical analysis of the decisions of the War Labor Board was made as rapidly as decisions appeared. Some effort was made to compile the experience of Great Britain in its labor policy. Attention was given to the opinion of labor as reflected in labor papers, in order, if possible, to remove friction and forestall objections which might be made.

Poster Division.—The function of this division is amply indicated by its title. Beginning with a number of small posters distributed among a limited number of manufacturers in April, the Poster Division grew until in the month of November it was distributing upward of 700,000 posters monthly to business concerns throughout the country. The growth of the poster distribution is a proof of its value, for it must be recalled that this service was not granted to any firm except upon its own request.

RECONSTRUCTION.

Up to the time of the signing of the armistice the work of the Information and Education Service was devoted to getting the attention of the country fixed on war industries. Its subsequent efforts were to assist in restoring peace conditions as rapidly as possible. In particular the problem of unemployment was of vital importance. Prior to the armistice a severe shortage of labor had been felt. The release of workers in vast numbers from war industries was not accompanied by an immediate revival of normal peace-time industries. The result was widespread unemployment, temporary in nature it is

true, but nevertheless serious. It was particularly serious in view of the fact that the armistice was signed at the beginning of winter. One of the happy circumstances of history is the fact that the Civil War had ended in the spring and men stepped practically from the battlefield to the furrow. The armistice, on the other hand, was signed at the time when normal unemployment is most pronounced. Under such circumstances the Department turned as a means of relief to the stimulation of certain industries the product of which had been greatly diminished in volume as a result of the war. Notable among these were the related activities of public works construction and private building. It was, therefore, determined to focus on building in particular as a specific activity and to conduct a general campaign to stimulate buying so as to assist manufacturing in general. Hence, the last few months' activities of the Information and Education Service were used to stimulate building and buying. For the purpose of supervising such activities as related to building in its relation to better employment, a special division was created known as the Division of Public Works and Construction Development.

Special sections were organized to deal rapidly with the materials needed for a quick, effective campaign. Economists who were familiar with the conditions of the industry were summoned from various parts of the country. Under their supervision there was gathered a considerable amount of data on the forces and methods of supply of real estate loans, on building material, on wages of the building trades as compared with general wages, on the cost of living, on general conditions of labor in the building trades, and on the amount of private and public construction during the war years as compared with normal construction. The results of this investigation have been published separately. Under the supervision of the Statistical Section no fewer than 26,000 questionnaires were sent out to determine the amount of building suspended during the war and the reasons why the work was not resumed after the signing of the armistice. Upward of 7,000 replies were received showing a total amount of suspended building of nearly \$2,000,000,000. Of this amount more than two-thirds was for public works and the remainder private construction. A supplementary questionnaire in two parts dealing with real estate was also prepared. The purpose of this questionnaire was to collect reliable information reflecting the investigation status of typical improved properties throughout the country from 1914 to 1918, inclusive. It was sent to 125 secretaries of real estate boards throughout the country who in turn formed representative committees to collect the data.

As a means of carrying out the main purpose of the campaign, a section was instituted to interest the Nation in home owning. Campaigns were projected in 92 cities and actually organized in 78. Cor-

respondence, some of it leading to legal action without further cooperation on the part of the Department and concerning which no detailed information is on file, was conducted with organizations and officials of nearly 2,000 cities. A special section was organized to draft a bill for the promotion of a system of banks to be known as Federal Home Loan Banks. Conferences were held with many officials of building and loan associations in all parts of the United States and a bill was finally devised which met the requirements of the Secretary of Labor and the essentials set forth by building and loan associations. The bill as drafted has already been submitted to Congress. It involves the building and loan associations of the country, 7,269 in number, with a total membership of 3,838,612 and total assets of \$1,750,000,000, to advance loans more abundantly to home builders.

Effect upon building.—The exact amount of resumed building attributable to the campaign itself can probably never be determined, as it is impossible to separate that part which is due to stimulation from the part which would have occurred anyway. Nor is the Department concerned with making such a separation, although it believes that a great deal of the resumed work is in fact attributable to its efforts. The main consideration is that the work was done.

The most complete construction statistics available covered contracts let for engineering and building construction north of the Ohio and east of the Missouri, together with some adjacent area, containing four-sevenths of the population of the country. The contracts let for the first five months of 1919 (cost put up to 1919 price level) compared with the same months of 1915-16 were as follows:

Month.	1919	1915	1916
January.....	\$51,000,000	\$69,800,000	\$87,500,000
February.....	95,000,000	79,600,000	91,600,000
March.....	151,000,000	122,600,000	131,200,000
April.....	191,800,000	124,100,000	140,300,000
May.....		125,200,000	182,500,000

The total for March, 1919, exceeded the total for March of any other year but one, even with the cost of former years brought up to the 1919 price level. The totals for April and May exceeded the totals for April and May of all previous years even with costs adjusted to the 1919 price level. The revival of construction activity was more notable in the Middle West than in the East and in the smaller than in the larger cities.

Employers' Industrial Commission.—Early in the winter of 1918 it was evident that world industrial conditions were in flux. New groupings were in progress. Vast industrial reorganizations were in contemplation. It was felt on every hand that a knowledge of events

as they were progressing abroad would be of immense value to ourselves in handling problems then acute abroad and which might later arise in our own country. Of course, there was no assumption that a solution of any American industrial problem was to be found in merely following European precedent. Nevertheless, it was felt that a knowledge of events as they were then transpiring would be of great value, particularly in the case of Great Britain, because of the belief which is common in America that British industrial experiences have for many years been along the same paths as ours. While it is an arbitrary assumption that industrial history in the United States will necessarily flow in the same channel as that of Great Britain, it is nevertheless true that there is sufficient similarity in the commercial customs and industrial development of the two countries to warrant the statement that a knowledge of the experience in one is valuable in interpreting possibilities in the other.

Particular interest in foreign experience had been manifested by many employers who were in constant correspondence with the various bureaus and services of the Department. It was determined, therefore, to send to Europe a commission of representative employers for the purpose of ascertaining—

- (1) The attitude of employers toward problems of labor with special reference to their idea of the adjustment of disputes.
- (2) The views of the working classes and the attitude of the labor leaders.
- (3) The methods and plans of Governments to allay labor unrest.

The members of the commission were:

E. T. Gundlach, Chicago, Ill., chairman.

R. J. Caldwell, New York, N. Y.

Dorr E. Felt, Chicago, Ill.

William H. Ingersoll, New York, N. Y.

Eldon B. Keith, Brockton, Mass.¹

R. R. Otis, Atlanta, Ga.

The commission was accompanied by Dr. Royal Meeker, Commissioner of Labor Statistics in the Department of Labor, as economic adviser to the commission. Mr. B. M. Squires, a commissioner of conciliation in the Department, was appointed statistician. Two months were spent in travel and study. Among the subjects investigated were the shop-steward movement, the Whitley plan for joint standing industrial councils, unemployment insurance, health insurance, hours of labor, housing, minimum wage, compulsory arbitration, etc.

The report of the commission has been published as a separate volume and need not be further referred to in this report. The

¹ Commissioner Keith died while in London

following summary of its findings is appended, however, as it states in condensed form the substance of the report itself:

In conclusion, we submit the following findings:

1. Employers in Great Britain generally recognize the desirability of bargaining collectively with labor.
2. Employers nearly all agree that collective bargaining should always be undertaken between associations of employers and the regularly established well-organized trade-unions.

While many manufacturers welcome organizations of workmen in their factories (shop or works committees), they want to limit the activities of such bodies to purely local grievances, and decidedly desire that the committee members come under the discipline of their unions.

3. Most employers freely recognize the right of labor to organize; they regard organization as greatly contributing to the stability of industry. Some large manufacturers declare that they wish to see every workman within the unions, so that they must all come under organization control. Others feel that 100 per cent organization might lead to dangerous types of universal strikes and lockouts. The more conservative employers appear to make no effort to help along organizations of labor, merely dealing with such organizations when they appear on the scene.

4. Employees in Great Britain are divided in sentiment shading from those who want to maintain the trade-unions along the regularly established so-called "constitutional" lines to ultraradical socialists.

5. Employees are nearly a unit, however, in expressing opposition to the use of force. The most radical who desire "now" a complete overturning of the present social structure usually admit on close questioning that "now" may mean many years. They want to "start" now. Practically none appear to approve of a sudden change, as in Russia.

6. Employees of the ultraradical type look askance at collective bargaining and organizations of labor and capital. They freely express the view that they do not wish harmony between employees and employers, since harmony would help to continue the present system of society.

7. Employees of the more conservative type (and to your commissioners they appear to represent the vast majority of British workmen) are largely in accord with employers in the desire (1) to head off labor unrest at this period; (2) to strengthen the unions by holding members under control; (3) to increase production for the sake of the nation, workmen included—with no restriction on output except as it affects the health of the worker; (4) to leave control of business policies in the hands of those managing the business.

8. Government officials appear to be uniformly of the opinion that the Government should function in labor unrest only as an absolutely last unavoidable resort. On the other hand, they maintain the right of the Government to step in when necessary in order to protect public interests against minorities which try to force their terms upon the people.

9. In general the Government, and most employers and conservative employees, appear to be agreed:

That the spirit of cooperation between labor and capital is highly desirable.

That the spirit of conciliation is important for the benefit of the employer in stabilizing his business and for the benefit of the employee in preserving his regularly organized unions.

That in collective bargaining the right-minded employer will not attempt to return to the prewar industrial era, and that the right-minded employee will not attempt to crowd his demands to the point at which the stimulus for private business enterprise would disappear.

The spirit of a genuinely better new (and not novel) era is thus being fostered by widely varied elements of Great Britain's industrial system.

Conference of governors and mayors.—While the declaration of war by Congress in 1917 abruptly changed our legal status from one of peace to one of war, the actual adjustment of industry was gradual. Much of it, in fact, had already been accomplished, and many of our industries were already upon a war basis by reason of the fact that workshops and factories had been manufacturing munitions for upward of three years. In sharp contrast to this gradual transition was the abrupt change created by the signing of the armistice. Previous to the suspension of hostilities all the facilities of the Department had been exerted to their utmost to supply a serious labor shortage. With the release of large numbers of men from the Army, the shortage was converted into a surplus. The cancellation of war contracts left plants idle which had in many cases been driven at top speed for four years. Through the United States Employment Service the Department had endeavored in every possible way to assist men demobilized from the Army and persons thrown out of war employment. The basic situation, however, was of such a nature that a mere employment agency could do little more than minimize its evils. Temporarily, at least, there were more jobs than men. As has been indicated elsewhere in this report, the Department set about the stimulation of various projects for the purpose of creating buffer employment. Among the means suggested was the revival of the construction of public improvements. Unfortunately, however, very few of these projects were under Federal supervision, and any work to be accomplished along those lines must necessarily have been accomplished through the direction of State and municipal governments. For the purpose, therefore, of considering this important subject, as well as to make common concern of many of the other problems of reconstruction, there was arranged by the Information and Education Service; under the direction of the Secretary of Labor, a Conference of Governors and Mayors on March 3, 4, and 5, 1919. This conference was attended by chief executives or their representatives from 47 States, 22 governors attending in person. In addition there were present mayors from 184 cities. Representatives of municipalities were present from 41 out of the 48 States.

During the three-day session the delegates were addressed by the President of the United States and by six members of the Cabinet.

The conference adjourned on March 6, subject to the call of the Secretary of Labor to meet again early in 1920. One of the results of the conference was the appointment of an organization committee to draft a proposed constitution and by-laws for submission to all dele-

gates at the next conference, with the idea in view that some form of permanent league be adopted which would arrange to meet annually in Washington. The members of the committee of five were as follows: Mayor George L. Baker, of Portland, Oreg.; Mayor Frederick W. Donnelly, of Trenton, N. J.; Mayor W. Montague Ferry, of Salt Lake City, Utah; Mayor Daniel W. Hoan, of Milwaukee, Wis.; Mr. R. J. Wheeler, of Allentown, Pa.

It was further voted that the next conference should include the mayors of all cities of 25,000 population or over.

BUREAU OF INDUSTRIAL HOUSING AND TRANSPORTATION.

Organization.—The Bureau of Industrial Housing and Transportation was established in February, 1918. In July, under authority of an act¹ of Congress, the United States Housing Corporation was formed and took over the work previously begun by the bureau, with the exception of certain minor matters where it was deemed advisable to continue in the name of the bureau. An appropriation of \$100,000,000 was made available for the use of the Housing Corporation July 25, 1918. It was not possible to make contracts for the building of houses prior to that date. The period of greatest activity, therefore, of the United States Housing Corporation was between July 25 and November 11, 1918.

Purpose.—The establishment by the Federal Government of an agency to build houses for industrial workers was due to the nature of the war emergency. War industries to fulfill their contracts were forced to employ thousands, and some of them even tens of thousands of additional workingmen. The housing facilities of the cities in which these industries were located were as a rule quickly exhausted and new houses could not be built by private capital in sufficient quantity to meet the demand. Though unskilled laborers could in most instances be drawn from the community in which the war industry was located, skilled workers could not be so readily found and had to be attracted thither from all parts of the country. They could not be induced to come, or in any case would not stay on, unless there was a possibility of providing homes to which they could bring their families. As the draft increasingly removed the unmarried worker from the industrial field, the problem of housing the skilled married worker became more prevalent. As the labor turnover often ranged from 200 to 300 per cent a year, with attendant loss of efficiency and delay in the production of war materials, the problem of housing the industrial worker was one of the most urgent problems that the Federal Government was obliged to face.

The first essential was to secure accurate information concerning the housing needs of each of the industrial cities which complained of

¹ Public No. 149, 65th Congress, H. R. 10265, and Public No. 164, 65th Congress, H. R. 12280.

housing shortage and delayed war contracts. There was established in the Housing Bureau a Division of Preliminary Investigations, which subsequently developed into the Division of Surveys and Statistics. By means of careful questioning of the officers of the industrial plants which claimed a need of housing and a thorough study of the community within which these industries were located, the actual needs were quickly analyzed and recorded. By means of such investigation it was found that some cities claiming a housing shortage were suffering from no problem which could not be met adequately by a full utilization of local forces. On the other hand, there were more than 100 cities in which the problem of housing some class of the labor employed was already serious or was certain to become serious if workers were added to the existing force in the numbers contemplated by the industrial plants in question.

Utilization of existing facilities.—Had the war continued, the major resource would doubtless have been to transfer laborers engaged in less essential industries to war industries within the same community. War contracts could also have been distributed to a larger extent than they were during the first years of the war to those communities which had abundant labor and housing. But while these more fundamental plans were being perfected by the various contracting governmental departments, the immediate problem of housing the labor in centers already dangerously congested had to be met by means which could be put into operation immediately.

The first essential after ascertaining the housing needs of a community was to utilize to the utmost its existent housing facilities. The Homes Registration Division was, therefore, established and charged with the making of vacancy canvasses in all industrial communities reported as congested. Such canvasses covered every vacant house and flat, and where necessary every vacant room in occupied private dwellings of the city and its accessible suburbs. In cooperation with the Council of National Defense and local councils and other civic agencies a branch office of the United States Homes Registration Service was established, managed, and supported by local citizens, but reporting weekly to the Housing Bureau and executing its orders. Vacancy canvasses were thus made in over 100 cities, and 66 registries were established prior to the armistice, which had made 32,679 recorded placements of war workers up to November 16, 1918. By June 30, 1919, 71,481 persons were recorded as placed by the registries. Very considerable numbers of unrecorded placements were made, so that the above figures do not represent the actual accomplishments of this service. The homes in which these war workers were placed were in wholesome neighborhoods and as well adapted to the needs of the applicant as the circumstances of the community permitted. The local Homes Registration Committees also induced many householders to

repair dilapidated dwellings and put them on the market, or to improve idle rooms in their homes and to offer them to war workers, thereby creating abundant new housing facilities at no cost to the Federal Government.

Commandeering of vacant houses.—In some of the most congested cities large numbers of properties were held vacant either from a failure to appreciate the seriousness of the local need or from a desire to sell the property at an exorbitant price. In Washington, Philadelphia, Bethlehem, Pa., Erie, Pa., and Shelton, Conn., it proved necessary to commandeer such vacant properties, as the owners could not otherwise be induced to place on the market, in order to render them accessible to war workers. In Washington 141 properties were taken over in this manner, and in Bethlehem 143 houses were commandeered. By means of this practice, in Washington 1,340 persons were provided with comfortable homes at a cost much less than that which would have been involved in new construction.

Assistance in private construction of houses.—The local housing problem was also met in part by assisting local house building corporations in securing priority orders for the construction of houses. All requests for such assistance were examined by the Priorities Section of the Requirements Division, and where house building was needed to take care of workers in war industries steps were taken to secure priorities for materials, and to license these corporations to build under proper restrictions which would safeguard the worker, both as to rental and sale. By this means licenses were issued through the War Industries Board for about \$43,000,000 worth of homes for workers.

Solving the problem through transportation.—The saturation of the industrial community was accompanied where possible by providing for the transportation of war workers to accessible neighboring communities, and all vacant addresses in these neighboring communities were listed with the central office of the Homes Registration Service, or else a branch registry was established. Where there was abundant housing in neighboring communities but not available because of poor transportation, the Transportation Division made a survey and recommended a program for solving the housing problem through improved transportation. This was accomplished in some cases by rearrangement of train schedules, in others by loans to transportation companies to increase their rolling stock, trackage, or other facilities. Such loans were made on proper security and bore 5 per cent interest. Altogether loans to the amount of \$7,454,104.35 were contracted for, which have been reduced by \$1,533,383.88 since the signing of the armistice.

In other cases it proved desirable to run special trains from the war industry to a neighboring city where there was abundant hous-

ing. Fourteen such trains were arranged for at no expense to the Housing Corporation. Nine other trains were provided at special fares. Thus the provision of special express trains from shell-loading plants of the Amboy district to Asbury Park and Long Branch was a means of providing excellent housing for approximately 2,000 workers who commuted daily. Though the regular fare for this round trip was 42 cents the corporation arranged to have the fare reduced to 25 cents, absorbing the 17 cents differential.

Measures preceding house construction.—After thorough canvasses, comprehensive publicity, and appeals had opened up and utilized fully the available existing housing resources of industrial cities there was still in not less than 94 cities need for construction of housing accommodations for one or more classes of the industrial population.

When it was clear from the reports of the investigators that the problem could not be solved by saturation, transportation, or by any means short of erection of houses, a staff meeting was held, at which representatives of the War and Navy Departments were present, and a tentative allotment of funds was made to such community for the construction of houses. Then a real estate expert was sent to the community to report upon available properties and upon general values. Upon his return there would next go a committee on sites, composed of architect, town planner, engineer, and real estate expert for the purpose of choosing a specific site, taking into consideration all of the various factors affecting its location. The findings of this committee were reported to the staff meeting with recommendations. After the latter had been approved a special architect, town planner, and engineer were appointed for that project, and steps were taken through a real estate negotiator to secure land.

Acquisition of land.—Local appraisals of property were secured through the real estate board, the mayor, the assessor, the chamber of commerce, and the rotary club. The negotiator, armed with this information, undertook to secure the property from the owner at a reasonable price, and this price was submitted for approval to the president of the Housing Corporation. Altogether approximately 19,000,000 feet of platted land and about 2,800 acres of unplatted land were contracted to be purchased by the Housing Corporation, at a total cost of \$4,879,700. The corporation did not take advantage of the vendor, but was able to show him that it was informed as to actual values, and was, therefore, able to secure property at a fair price. The corporation tried to establish in the minds of the people the fact that the intention of the Government to purchase land should not be allowed to increase its value.

In 124 cases, to avoid delay in the acquisition of land, the bureau resorted to its power to requisition land. Altogether approximately

5,000,000 feet of platted land and 492 acres of unplatted land were requisitioned.

Planning the houses and environs.—The plans drawn by the local architect, town planner, and engineer were submitted to the Architectural, Engineering, and Town Planning Divisions to check with reference to standards established by the Housing Corporation and for suggestion. These three constituted a committee on design and worked in constant collaboration.

As the housing required was in practically every instance for skilled workers and not for day laborers—sufficient numbers of the latter class being available in practically every community—the houses had to be designed with reference to the requirements of skilled operatives and their families. The mode of living of the skilled workers was studied and the needs of their wives were successfully canvassed in order to ascertain what type of house would best meet their needs and wishes.

As local customs with reference to materials, planning, and equipment of houses for industrial workers vary materially throughout the country the types of houses required proved to be quite diverse, but it has been the aim of the Housing Corporation to consider the best prevailing local types and to provide housing which would be of good quality, but which would not deviate too widely from the types of houses to which local people were accustomed. It was possible to devise a relatively small number of house plans which could be duplicated in all the houses of the community. To avoid monotony, quite diverse exteriors were designed for houses of the same house plan in the attempt to design communities which would be attractive to the working man's family, and which would, therefore, increase his health and contentedness, and make it worth his while to stay in the industry for which he was working.

While the function of the architect was to design the house, the project town planner was responsible for the plan of roads and walks, subdivision into lots, the arrangement of buildings on the lots, the arrangement of recreation spaces, etc. The project engineer was charged with the provision of sewers, sewage disposal, lighting, water supply, grading of roads, sidewalks, etc.

Letting of contracts.—The completed drawings after approval were submitted to the Construction Division, which let the contracts. A list of responsible competing contractors was prepared and invitations to bid on the buildings were sent to those who were found to be reliable efficient, and financially able to handle work of this character. If contractors living within the vicinity answered these qualifications they were given opportunity to bid. The Requirements Division prepared an itemized estimate of the cost of the proposed buildings, which was used as a standard to check the bids. The materials were purchased through the Construction Division of the Army, which

fixed prices for the materials entering into construction. The contract was given to the lowest responsible bidder.

A few of the first contracts let were for a fixed price, but it was soon evident that fixed-price contracts could not be let except at exorbitant prices, because the contractor had to make allowances for very rapid increases in costs of materials and labor. It proved more economical, therefore, to apply a modification of the fixed-fee plan under which the Estimating Section of the Requirements Division of the Housing Corporation set a maximum fee which the corporation should pay, but in the contract it was agreed that if the final cost of the work exceeded this estimate the contractor would be penalized to the extent of one-half of his fee. If, on the other hand, he effected a saving under this estimate he could receive 25 cents on each dollar saved up to the limit of one-half of his fee. Some of the contracts did not contain the penalty feature, but all of the fee-basis contracts contained the provision for a fixed fee with a bonus for a saving in cost. The average contractor's fee for contracts over \$1,000,000 was only $2\frac{1}{2}$ per cent, on contracts of less than \$1,000,000 the average was about $3\frac{1}{2}$ per cent.

Field organization and procurement of materials.—A works superintendent was appointed to each project, with general authority over the work of the contractor and with the duty of seeing that the work conformed to the specifications. A field auditor and disbursing officer were also appointed. The Materials Procurement Branch of the Construction Division arranged for the acquirement of materials and for priority shipments through the War Industries Board. Labor difficulties on the project were handled through the Industrial Relations Division, which looked after the arbitration of difficulties and arranged for the health and comfort of the laborers. By winning the respect and loyalty of labor, the Housing Corporation was able to maintain its 10-hour day with Sundays off for contract work, although other enterprises had bid against it with a 12-hour day and Sundays included.

Effect of the armistice on the housing program.—During the week of the signing of the armistice, when it became clear that active warfare would probably end, the Housing Corporation ceased to let contracts and immediately abandoned 48 of its projects and curtailed 15 others, 22 being allowed to proceed as planned. The projects which were abandoned were those in which work had not been carried far, and in communities where there would be little probable peace-time demands for the houses which were in contemplation. The projects which were carried to completion were those in which construction work had been carried so far that it seemed probable that there would be less ultimate loss to the Federal Government through their completion than through their cancellation. They lay in communities

in which there was a permanent demand for the kind of housing facilities which were being provided and in which there was, therefore a probability that the houses could be disposed of when finished at a price sufficient to warrant their completion. Altogether 5,899 families are provided for by the amended program of the Housing Corporation. Dormitory accommodations were provided for 8,109 persons. The approximate final cost of the projects is \$35,000,000.

Rental policy.—The management of houses, apartments, and dormitories is in the hands of the Operating Division. For each project there is appointed an operating representative, who is responsible for the renting and the upkeep of the houses, and for the welfare of their occupants. For the present all houses are being rented. Rental prices have been fixed after careful study of the cost of construction, the prevailing rentals of the city, and the ability of the working men to pay. An attempt has been made to fix a price which will be fair to the working man and to the Federal Government, and a price which will not discourage private building enterprise within that same community, for it is recognized that as the Federal Government has built houses for emergency purposes only it would be poor policy for the Government in managing its properties to charge rents so low that private builders could no longer afford to build. The American working man does not want to be subsidized, and in our experience he has proved willing to pay a just price.

STATISTICS OF OPERATION.

On July 5, 3,515 of the houses and 159 of the apartments were reported occupied.

On the same date, 778 persons were reported as residents in hotels and dormitories constructed by the Housing Corporation at Quincy, Kittery Point, and Vallejo. The Government hotels for women war workers in Washington, authorized by Congress under the war housing act, approved May 16, 1918, are now complete. Before the creation of the House Corporation on July 25, 1918, working plans had been made and the contract was let on August 2. Construction began immediately, but numerous delays occurred, due to difficulties in securing building materials and equipment. The signing of the armistice and the consequent uncertainty of the future of those buildings was responsible for further delay.

In spite of all these obstacles, however, the first unit of 150 rooms was opened on December 19, 1918, four months and 17 days after the contract had been let. The various units for convenience are designated by letters of the alphabet, as A-B Building, C-D Building, etc., each consisting of two wings.

The 12 units are designed to accommodate 1,950 persons, including staff, and by July 15 they were 100 per cent occupied. There are

two dining rooms which seat 1,068 persons; there is a central power plant, a laundry, a small infirmary, and a small recreation hall. The dining room in the Plaza group opened on March 8, 1919, and has since been taxed to the limit. The dining room in the Capitol group was opened May. 19, 1919, in charge of a trained dietitian, who is expected to provide wholesome, palatable meals suitable for indoor workers. The Government employees who live in the residence halls pay \$45 a month for a room and two meals on work days and three meals on Sunday.

The resident units are designed to provide a maximum number of small single rooms supplied with running water, and having convenient access to bathrooms. There are general living rooms in each unit where guests may be received. The management is composed of trained specialists and the aim is to provide at a minimum expense comfortable living conditions for Government workers.

Disposition of materials.—Since the armistice, the major work of the Housing Corporation has consisted, first, in the completion of the houses in communities in which it had undertaken to build and in the operation of these houses when they have become ready for occupancy. The next most important function of the corporation has been to dispose of materials the curtailment of projects had rendered useless, and in the adjustment of claims against the corporation for damages incurred through the cancellation of contracts.

Reduction of personnel.—Coincident with the process of cancellation and salvage it was possible to eliminate the Division of Surveys and Statistics in the month of November and the Requirements Division in February, and to make continuous reductions in the personnel of each of the other divisions. On June 30, the Homes Registration and Information Division, the Industrial Relations Division, and the Town Planning Division were closed down. The Engineering Division was closed on the same date, and a small staff of engineers was transferred to the Construction Division to supervise the completion of street paving and public utilities and look after loans made to the municipalities. The Transportation Division has similarly curtailed its staff, but is forced to retain some men to supervise the loans and construction contracts for which it is responsible. The Committee on Requisitioned Houses turned over its work to the Operating Division on June 30, 1919. It had already returned to the owners all but 12 of the 141 properties requisitioned, without having incurred any damage suit. All of the houses which had been operated by the committee are now closed, those retained being leased to persons to provide rooms for war workers, subject to the supervision of the corporation and at a rental which is in no case less than the rental paid for the property by the corporation to

the owner. In many instances the rental provides a return which not only meets fixed charges but is amortizing the expenditures previously made for repairs. The Real Estate Division is completing its negotiations for the sale of properties acquired which are no longer needed.

Cancellation and modification of contracts.—The cancellation and modification of contracts has been handled through the contract branch of the Construction Division. By May 19, 1919, construction contracts to the extent of \$4,517,897.92 had been substantially completed, work was proceeding on contracts to the amount of \$27,843,226; contracts to the value of \$25,111,794.79 had been canceled at an approximate final cost of \$5,224,177.81. There were canceled without loss projects to the value of \$5,706,614.27, and projects to the value of \$275,000 were taken over by the Army. Contracts amounting originally to \$63,454,532.98 had been reduced since the armistice to a final cost of \$10,782,288.43, after all necessary allowance has been made for additional costs on the continuing contracts.

Adjustment of claims.—By May 19, 1919, the committee on adjustments had acted on claims of 36 different project cities, in addition to miscellaneous claims amounting to \$778,159.90. It had settled claims amounting to \$1,902,730.33 for the sum of \$1,146,641.32, representing a total saving of \$756,089.01.

PREPARATION OF THE FINAL REPORT.

In the process of planning and building houses in 26 different American cities, the United States Housing Corporation has gathered together from a variety of professions men possessing expert knowledge in their particular fields. These men before leaving the service of the corporation were asked to prepare statements of the more important phases of their work, which have been assembled and edited for the "final report to Congress covering in detail all the operations and transactions, under and by virtue of the terms of this act" which the Housing Corporation is required to submit "immediately after the declaration of peace."

The volume containing illustrations of the work of the Design Divisions with brief descriptive statement was prepared early while the persons who had directed these important activities were still with the Housing Corporation. These persons have in practically all instances now left the service of the corporation, and this volume has already been printed.

Disposal of the records of the Housing Corporation.—The large number of daily inquiries received by the United States Housing Corporation for information on varied aspects of this comprehensive subject have convinced the directors of this corporation that some

permanent provision should be made by the Federal Government for the utilization of the materials and the information which have been collected by the Housing Corporation and other branches of the Government which have been charged with work in this field. The almost universal shortage of housing accommodations has led to an exceptional amount of interest in this field, and has brought the subject intimately home to every chamber of commerce, manufacturers' association, and real estate board. It is apparent that the materials on this subject gathered for an emergency purpose should not be stored in some out of the way place, but that they should be rendered available for the service of the home builders of America.

COMMISSION ON LIVING CONDITIONS.

Origin and function.—The Commission on Living Conditions of war workers was appointed by the Secretary of Labor during October, 1918. Its members were: Mr. John R. Richards, Mr. J. Horace McFarland, Mrs. Eva W. White, Mr. John A. Voll, and Miss Edith Rockwood. The function of the commission was to learn where bad living conditions were a factor in retarding war production and to devise ways and means of improving such conditions.

History.—The first meeting of the commission was held on October 21, 1918. Immediately following the organization of the commission conferences were held with officials of the War Department, United States Housing Corporation, and other Government agencies for the purpose of making a preliminary survey. It was found as a result of this survey that recreation was one of the serious lacks in war industries centers. After consultation many organizations were interested in this subject. The Playground and Recreation Association of America was accordingly asked to undertake the coordination and stimulation of local agencies in communities in which large numbers of war workers were housed to meet the social recreational needs of the workers. As a result of conditions discovered by a survey of 31 cities, the War Workers' Community Service was organized in 30 of them. The limits of this report with regard to space preclude a detailed account of these activities. The best evidence of their value, however, is the desire for their continuance shown by the local communities.

Late in October reports reached the Department of Labor that Porto Ricans brought over by the Employment Service of the Department to work on construction of Army cantonments were not receiving fair treatment.

A personal investigation made by a properly authorized officer of the commission revealed the fact that Porto Ricans at Camp Bragg had been unintelligently supervised and unfairly treated. At Camp

Jackson, S. C., on the other hand, conditions were good. Upon the basis of these investigations steps were taken by the War Department to provide transportation for those who wished to go home and to improve the conditions of those who chose to remain.

Special work in Washington.—The excessive increase in the population of Washington, D. C., created an extremely serious situation during the winter which was only in part relieved by the exodus following the armistice. The Commission on Living Conditions was largely instrumental in securing the reopening of the Emergency Hospital to care for war workers suffering from influenza after the first epidemic had passed. Great assistance was given the War Camp Community Service in its preparation to care for recreational needs of Government employees. The National Recreation League was aided during the winter and was finally placed upon a firm basis by affiliation with the Federal Employees' Union. At the suggestion of the Commission on Living Conditions the Federal Social Service Workers were organized for the purpose of studying the working and living conditions of Government employees. Their first joint action was the presentation to the Committee on Public Buildings and Grounds of the House of Representatives of the need for Government hotels in Washington. Sentiment at that time was strongly for the abandonment of those projects, but the hearing resulted in the decision to complete and operate the buildings.

The Community Service.—As it was desirable to learn what services the Federal Government offered to communities, the commission had periodical conferences with representatives of the Bureau of Education, the States Relations Service, the Bureau of Markets, the Children's Bureau, and many other Government agencies which did work of a community character. The purpose of these conferences was to arrange a method by which the commission might solve the particular problems of communities without setting up a machinery of its own but by the assistance of already existing governmental facilities which needed only to be extended. Through the commission the city of Harrisburg was assisted in organizing a homes registration service to aid in the acute housing situation which became apparent after the war. In addition, on consultation with the commission, a bill was passed by the Pennsylvania Legislature which provided for an increased use of school buildings for community purposes.

Postwar activities.—The signing of the armistice necessarily changed the plans of the Commission on Living Conditions. Thereafter more attention was given to the formulating of national policies relating to housing and living conditions and relatively less to the concrete problems of particular places. Among the more important matters which received its attention was the attempt to unify the housing policies of the various governmental bodies which were building homes. Fre-

quent consultations were held with officials of the United States Housing Corporation, the Emergency Fleet Corporation, and the War Department Ordnance Bureau in relation to the completion, operation, and disposal of the properties under the jurisdiction of those bodies.

In January a conference was called to see whether the three agencies could not find means of developing a single housing policy to be applied to all properties of the Government. No common basis, however, could be found upon which the Emergency Fleet Corporation could work with the United States Housing Corporation. The War Department, however, agreed to assign its permanent properties to the United States Housing Corporation for operation and disposal.

The conclusion of the commission, with regard to the completion, operation, and disposal of the Government's housing and transportation properties are embodied in the "Program of Disposition of War Housing and Transportation Properties of the United States Government and for the Promotion of Community Housing Service after the War." This was prepared at my request for submission to the President of the United States.

Finances.—The Commission on Living Conditions was an adjunct to the United States Housing Corporation and financed by that body. It received an allotment from the housing funds of \$25,000. Of this, \$20,798.47 was expended, leaving an unexpended balance of \$4,201.53, which was returned at the end of the fiscal year.

WORKING CONDITIONS SERVICE.

Origin and functions.—The sundry civil appropriations act for 1918-19 carried an appropriation of \$45,000 to "enable the Secretary of Labor during the present emergency to carry on the work of war labor administration, including the working conditions of wage earners in the most essential war industries." This was in general compliance with the President's memorandum six months earlier which directed the Secretary of Labor to set up "machinery for safeguarding conditions of labor in the production of war essentials." Authority for performance of this function had existed, however, since the organization of the Department itself and is found in the organic act of the Department, which directs the Secretary of Labor to improve the working conditions of wage earners throughout the United States. The service was organized on July 1, 1918. More specifically, its duties were to examine into the matter of working conditions in war industries, to determine standards as to conditions which should be maintained in those industries, to adopt rules embodying such standards and explaining them, to determine the best means of securing the adoption and maintenance of such standards, and to cooperate with State authorities for the above purposes. The experience of the allies had demonstrated that a service of this kind was

essential in order to secure the largest possible output in munitions of war. Where no supervisory power over conditions of labor was exercised, health precautions were disregarded and the hours of labor extended, with a consequent reduction in health and efficiency. In the United States, it is true, the laws of the States provide certain standards of working conditions. The laws, however, were not uniform among the States and had in general been adapted to peace industries. Frequently they bore no relation whatever to the industries which sprang up since the war. A central authority, therefore, was necessary to investigate working conditions, if for no other reason than to advise the States as to the operation of their laws and to provide proper standards and conditions in Government contracts so as to secure the maximum war production.

WAR WORK.

Organization. —In dealing with working conditions as a war problem, the primary necessity was to avoid complicating an already complex situation. One of the principal reasons for authorizing the Secretary of Labor to act as War Labor Administrator was the necessity for securing a centralized authority responsible for standards and administration. Practically every production department of the Government had established a separate labor administration with consequent multiplicity of inspectors and standards. As a result of this decentralization of control, managements in industries were forced to submit to numerous inspections and were so confused by conflicting orders and standards that production was impeded. The first duty of the Working Conditions Service, therefore, was not to add to the already existing multiplicity of standards, but to secure cooperation of all production departments in furtherance of a common policy and program.

An analysis was therefore made to delimit the scope of the service. It could not, for instance, take cognizance of industrial controversies and those problems which are properly the field for agreements between management and employees. Its functions were considered as limited to the conditions of environment and processes that affect the health of the workers and their safety, and those personal relations between employers and employees that grow out of association for production purposes. Upon this theory an organization was planned to consist of a Division of Industrial Hygiene and Medicine, a Division of Labor Administration, and a Division of Safety Engineering.

In organizing the first of these it was necessary to take into consideration the proclamation of President Wilson of July 1, 1918, by which all Federal agencies dealing with health problems were instructed to make use of the facilities of the United States Public Health Service in order to avoid duplication of agencies. This division was there-

fore organized in cooperation with the Secretary of the Treasury, who was requested by the Secretary of Labor to detail personnel from the United States Public Health Service for this work.

Preliminary to its organization for field work, plans were under way to centralize control over the sanitary inspections of war production. These efforts resulted in the Division of Industrial Hygiene and Medicine being designated by the War Ordnance Department to be responsible for all sanitary and safety inspections. It was also made responsible for similar work in arsenals and all construction projects for the United States Housing Corporation.

The second division to be organized was that of Labor Administration. In this field, also, there were various Federal agencies organized to promote better employment policies and practices. Agreements were reached, however, to centralize these.

The last division to be organized was that of Safety Engineering. Owing to the fact, however, that the Division of Industrial Hygiene and Medicine had been made responsible for safety and sanitation in the Ordnance Department, there was included in the personnel a number of specialists in accident prevention and safety engineering. It was therefore possible to carry on considerable accident prevention work without the organization of a separate division for that purpose. The division was therefore really not organized until after the armistice was signed.

In addition to these other agencies, a committee was established in the early days of the organization to draw up a code of sanitary standards for the making of explosives. The development of the work of this committee revealed the fact that it was impossible to secure the adoption of general practices and policies without the voluntary cooperation of all concerned, and that it was impracticable to attempt under emergency conditions to enforce uniform standards that should be maintained without modification to meet the exigencies of war production. As a result of this experience it was determined that the most effective way to promote continuous betterment of working conditions was to advise specific managements how to make improvements and to furnish industries with information and service designed to meet their varying needs and conditions rather than to concentrate on development of industrial codes.

PEACE-TIME WORK.

This principle developed in war experience became the central principle of the Working Conditions Service in the peace program also. Since it possessed advisory power only, it necessarily had to depend upon the good will and cooperation of both employers and employees in order to secure results. It was determined, therefore, to develop a bureau whose function and duty it should be to furnish industries with information and suggestions for the betterment of

working conditions. This purpose had both a humanitarian and a business value. Production must be upon a paying basis. But when suggestions for such betterment are based upon scientific data and have a practical application to efficient production they have a strong appeal to management. Every employer is interested in eliminating unnecessary costs, but all know how much industrial health, safety, and good administration of the working force contribute to that end. But employers should not be expected to know what constitute the most desirable standards and policies. They properly determine their general policies upon working conditions and then employ specialists to secure desired results. The working out of better methods and practices requires the application of science to the industrial field.

The Working Conditions Service therefore offered to industries a consultant service of specialists in employment management, industrial relations, sanitation, ventilation, illumination, medical supervision and service, and accident prevention. Industries were advised that upon request they could secure information and advice in dealing with industrial problems. Coming at a time when industries were facing the critical period of transition from a peace to a war basis and were very slow to make changes because of financial and commercial conditions, the generous and hearty response which the announcement met is a very definite test of the practicability and desirability of the assistance. What the Department of Labor offered was not a welfare proposal but a business proposal based upon the conviction that good working conditions are good business. Good working conditions build up a spirit of good will toward the management and result in greater efficiency and increased production. High labor turnover means high labor costs of production.

Division of Industrial Hygiene and Medicine.—The function of this division was to protect and improve the health of those employed in industry and thereby facilitate production. The program dealing with industrial health recognized two fundamentals—control over physical working conditions is in the hands of the management, and the approval and cooperations of workers are necessary to make equipment and regulations effective. Both workers and management may appreciate the value of good health, but the problem of what constitutes a sanitary work place, what processes and materials are harmful to workers, involve scientific research and determination by specialists. To furnish this scientific information and advice is properly the function of the Government. The only effective and constructive method is to find out what conditions cause sickness and secure the elimination of those conditions. By such preventive methods industrial losses through sickness can be reduced and the field for curative methods minimized. The researches of the division, therefore, cover three main fields:

1. General hygienic conditions in industries in order to determine wherein existing conditions both within and without the plants comply with sanitary requirements.

2. Special occupational diseases and poisonings, to ascertain cause, effect, and prevention.

3. Physiological requirements of various occupations as the basis for developing methods of proper placement of workers with regard to physical ability.

Illustrations of the kind of work done are numerous. One of the most important and comprehensive investigations was the study of the pottery industry. This was done upon the request of both employers and employees. The survey covered plants in four States and included not only the study of conditions and processes but physical examinations of the workers themselves. The results so far obtained have brought about the granting of insurance to workers hitherto denied because of the alleged hazard in the dipping process. Many firms have sought information and the assistance of specialists has in addition been furnished. The service rendered varies from the perfunctory furnishing of routine information to the drawing up of complete programs, including diagrams and the layout of buildings and equipment. Six district offices were established in Philadelphia, New York, Cleveland, Pittsburgh, Chicago, and St. Louis. The United States Employees' Compensation Commission requested this division to assume advisory and in some cases direct charge of plants, whose employees were judged to come under the Federal compensation law. In accordance with this arrangement five separate investigations were made and supervision was assumed in 11 large plants. Aid was granted in improving or installing systems of medical and surgical relief in 19 establishments. Investigations were made at the request of the Ordnance Department and detailed reports furnished in the case of 11 establishments. Requests for service involving technical skill were received from 11 others. Reports were received from field offices on investigations of hygienic conditions in no fewer than 105 plants. Excerpts with recommendations from plant reports upon investigations made since September 1, 1918, were furnished to 78 concerns. On July 1 researches had been completed in the case of 27 establishments and were under way in the case of 5 others.

Division of Labor Administration.—The Division of Labor Administration was organized on the theory that handling human beings in industry with knowledge and understanding of their personalities and with due consideration of their feelings, prejudices, and ambitions constitutes the problem of personal relations in industry as distinguished from industrial relations, which cover the controversial subjects of the division of the product and control of industry, such as wages, hours, unionism, and so forth. The personal problem in

industry, the problem of administering the human element that goes into production, ought not to be a matter of industrial controversy. Like safety and sanitation it is a technical problem rather than a problem for capital and labor to fight about. The function of the Division of Labor Administration, therefore, was to find out the best methods of administering the labor forces in industry and to pass on this experience to other employers by spreading the knowledge of the best methods as widely as possible among industrial managers. To accomplish these purposes, the division organized its work to enable it to render three kinds of services to industry, which may be grouped under the headings (1) information, (2) standardization, and (3) consultation. Under the head of the first was collected all available information on employment and labor-management problems. Their purpose was to analyze and classify such information and serve as a national clearing house of information upon the subjects. Under the head of standardization, the Department aimed to develop standard employment practices based upon the most successful experience as disclosed by information collected. Model employment forms and record systems, standard methods of keeping employment statistics and improved methods of employment department organizations were prepared and distributed among employers. Under the third heading the methods and information worked out under the other two activities of the division were made effective to individual employers. Whenever an employer desired it, employment experts were detailed to make studies of his individual plant and to make recommendations for improvement. During the existence of the Working Conditions Service no fewer than 167 establishments were so served. The problems involved ranged from absence and tardiness of employees to such subjects as profit sharing, employees' representation, and shop management.

Division of Safety Engineering.—The function of this division was to reduce accident hazards in industry. These fall within three classes: (1) Those due to engineering defects; (2) those due to unavoidable trade risks; (3) those due to the human element. The first of these requires but the cooperation of the employer; the second must necessarily be dependent upon structural changes in industry; the third, however, is a classification within which the greater number of industrial accidents come. Therefore, an important part of the program was to reach workers and provide the information to secure intelligent safeguarding on their part. Its work has, therefore, been of necessity a work of publicity and information, although many requests have been received and much service has been rendered in particular industries by special studies.

Discontinuance of the service.—In spite of the fact that the Working Conditions Service fulfilled a vital need, it was necessary to discontinue the entire service at the conclusion of the fiscal year, because of

the failure of Congress to appropriate funds for its continuance. That this was necessary is a source of regret. The supervision of working conditions is one of the three principal purposes attributed to the Department by the very act creating it. The Department is convinced that sooner or later a resumption of this work must be undertaken. Care has therefore been taken to preserve the records and information gathered by the Working Conditions Service during its lifetime in order that these may be not only available to the general public in the meantime but that they may also be made part of a similar organization when public and legislative opinion again shall have become focused upon the necessity for a constructive organization of this character.

THE DEPARTMENTAL CABINET.

Origin and purpose.—As has been pointed out frequently before, almost the entire subject matter of the Department of Labor deals with human relations. In consequence, occasions for the determination of policy arise oftener and the problems entering into such policies when established are necessarily more complex than when the subject matter is merely financial or material. During the war the extension of the number of bureaus and services within the Department rendered necessary the creation of some means by which the heads of these bureaus and services might be kept constantly informed as to the activities carried on by the others and as to the central policies of the Department itself. A Departmental Cabinet was therefore instituted within the Department for the purpose of maintaining coherency in departmental policy, as well as to promote friendly intradepartmental relations.

Membership.—The members of the cabinet are the Assistant Secretary, the Solicitor (as Acting Secretary), the Chief Clerk, and the administrative heads of the various bureaus and services. The Director of Negro Economics is also a member by special designation. During the war there were also included the heads of the various war emergency services and boards. The acting head of the Department at the time of a meeting is the presiding officer of the cabinet and the Chief Clerk acts as its secretary.

ASSISTANT SECRETARY.

As stated in previous reports of the Department, the functions of the Assistant Secretary are to perform such duties as are required by law or are prescribed by the Secretary. Those required by law relate only to circumstances arising from the death, resignation, or absence of the Secretary; those prescribed by the Secretary may relate to any or all of the functions of the Secretary at any time and under any circumstances in the Secretary's discretion, and may be prescribed either generally or from time to time as occasion demands. The official activities of the Assistant Secretary during the period of this report are

so involved in the general work of the Department to which this report relates that a special report with regard to his activities would be impracticable.

News release.—Among the special assignments of the Assistant Secretary has been the duty of indicating what announcements submitted by the various bureaus from time to time may properly be transmitted to the public or to the press. The organization of a central agency for the release of news has been found necessary in order to protect departmental administration from premature, unwise, or unauthorized publications.

Making new opportunities for employment.—The Assistant Secretary has also been in charge of investigations within the Department for the purpose of formulating a departmental policy with regard to the relations of wage earners to public lands. In my annual report for 1915 my views with respect to the principles which should govern such relationships were set forth.

In view of the high and increasing cost of obtaining a living and the consequent effect upon the temper of a patient people, the need which I have previously emphasized is becoming urgent. This is the need of creating new employment through the deliberate attempt to render more accessible the very sources themselves upon which our living depends. These sources consist in the land—its soils, its ores, and its forests. Access to these sources, through ill-conceived means of handling the industrial process, has become badly clogged. And if we would make progress through constructive and not destructive channels, there must be a wide-open door between land and labor.

The investigation in this field, referred to in my report of last year, has been completed with respect to its preliminary stage. Mr. Benton MacKaye, formerly of the Forest Service (United States Department of Agriculture), was engaged to make a general survey of this field and to report upon the possibilities of developing a national policy of land using that would attain the ends of greater accessibility. His report, "Employment and Natural Resources," has recently been issued by the Department. As part of the general investigation there has been published also a report by Mr. Leifur Magnusson, of the Bureau of Labor Statistics, on the "Disposition of the Public Lands of the United States with Particular Reference to Wage-Earning Labor."

Unfortunately, this important piece of investigation, through lack of appropriations, has had to be terminated.

This land policy, which I have been recommending since 1915, applies now with regard to our returned soldiers and our other citizens in the reconstruction to follow the coming of peace. It is embodied in part, but only in part, in what has been called the "back to the land" movement. In this movement the need is emphasized

of going back to the *agricultural* land. This of course is of primary importance and in previous reports I have mentioned the principles which should, in my opinion, guide us in furthering such a development. Agriculture should be carried on through the community unit, not the isolated farm unit; the farm community should be linked closely with the local city market through the direct postal motor truck rather than the roundabout railway car; above all the individual land tenure should be taken off the present basis of unearned profits and placed upon that of actual use.

But there are other ways of going "back to the land." Agricultural soil forms only one of the sources of life. The powers dormant in our coal seams, oil pools, and falling waters form another primary source. The structural materials in our hidden ores and our growing forests form still another. The coal, ores, and powers in our remaining western public lands should be held under public control. They should then be developed through public means and in a way to make them far more accessible to labor and the people's use than the deposits (once free) which form the basis of our present coal and steel industries. Could a policy of public accessibility have been applied on the coal lands of Pennsylvania and the iron lands of the Messabe Range the troubles now besetting these basic industries could never have arisen.

Proposed legislation designed to carry out the recommendations on this line in my report of last year was introduced last winter in the Sixty-fifth Congress by Representative M. Clyde Kelly of Pennsylvania. At a hearing on his measure, held in January before the House Committee on Labor, the Assistant Secretary appeared for the Department, and indorsed the legislation in principle. This proposed legislation was later introduced, in extended and improved form, in the Sixty-sixth Congress.

A program of land accessibility would require a vast amount of development work. To do this work Representative Kelly, in his proposed law, has provided for a public "construction service" to be handled in accordance with modern standards of labor and labor organization. This is an important means for the practicable carrying out of the program, and could in itself be made an opportunity for creating permanent employment which would be profitable alike to the worker and the public. Such a service would constitute also a means of preparedness against future emergencies of unemployment. This service should be established without delay.

Deferred classification of departmental employees.—The Assistant Secretary was also in charge during the period of the war of departmental requests to local draft boards for deferred classification of departmental employees. The calling of large numbers of able-bodied men to military service seriously affected the personnel of the Department and its various bureaus. Notwithstanding the needs of the

Department, its policy was not to ask for deferred classification of any person who could be replaced without substantial loss in efficiency. The practice was to act only upon the request of the immediate superior of the person for whom classification was asked. Such requests were referred to a departmental committee for recommendation. This committee examined carefully into the circumstances surrounding each request and made recommendations to the Assistant Secretary as to the necessity and desirability of his approval. The Assistant Secretary then determined the departmental policy in individual cases, upon the basis of the evidence developed by the committee and the reports it submitted.

SOLICITOR.

Functions.—The Solicitor is assigned to this Department by the Department of Justice. He is its chief law officer and legal adviser. By Executive order of February 16, 1918, in accordance with section 179 of the Revised Statutes he is also authorized and directed to perform the duties of Secretary of Labor during the absence of the Secretary and the Assistant Secretary, his official designation in this connection being Acting Secretary.

Report.—The Solicitor makes the following summary of activities in his office for the fiscal year ended June 30, 1919:

Legal opinions rendered, formal.....	48
Contracts and leases examined, approved, or disapproved.....	1,368
Contracts and leases drafted, redrafted, or modified.....	17
Bonds, official, examined, approved, or disapproved.....	10
Bonds, contract, examined, approved, or disapproved.....	16
Bonds, alien immigrants, examined, approved, or disapproved.....	1,472
Miscellaneous matters embracing everything submitted for advice or suggestion of the Solicitor, or for the formulation of departmental action, not included in the foregoing items.....	371
Total.....	3,302

APPOINTMENT DIVISION.

General conditions.—The work of the Appointment Division was necessarily increased during the period of the war. The natural increase of the work of the Department to which must be added many problems caused by the war activities and the period of readjustment following the signing of the armistice placed a very heavy strain upon the division. During the war period the Government service was greatly handicapped by being obliged to employ persons without proper qualifications to fill positions made vacant either by enlistments or the draft. In many cases it was practically impossible to obtain persons of the requisite skill. Many of those employed had absolutely no experience and in many instances were unreliable. Another element which lessened the general efficiency of the services was that large numbers of the experienced employees, with many

years of efficient service to their credit were kept at low salaries on account of the laws which limited the number of and compensation attached to the statutory positions in the various bureaus of the Department. Being paid from statutory rolls they had to be kept at the lower salaries and when new, inefficient, and inexperienced employees were brought in at much higher salaries these efficient but low-salaried workers were called upon to coach and teach them and supervise their work. Much commendation is due these old employees. Many of them could have gone into private work at increased compensation; but their loyalty to the Government kept them at the work which they felt was most important to their country. Had many of the old employees of the Government accepted the better positions which were theirs for the asking the conditions in the service would have been very much worse than they were.

Entrance salaries.—There should be no position under \$1,000 per annum in the Department save those of part-time employees, such as charwomen, etc., and those now existing should be so graded up that the present \$1,800 position would pay at least \$2,250. Under the present system Congress has created a number of positions ranging from \$720 to \$1,800 per annum. The low-salaried positions greatly exceed in number the higher salaried ones, and this should be reversed; or, at least, the number of higher salaried places should equal that of the lower. This would afford an opportunity for the lower salaried persons to get deserved promotions. Under the present system, with a schedule embracing possibly four positions in the \$1,800 per annum and other high-grade salaries and a hundred or more in the lower salaried grades it will be admitted that there are few opportunities for the lower salaried employees to advance. The chances of vacancies in the higher grades are necessarily limited by reason of the small number of such places.

Officials and employees.—There was an increase in the force of the Department of 1,975 employees as against 2,376 for the year ended June 30, 1918. The statutory positions were increased from 428 to 463, and this increase was mainly in the Bureau of Labor Statistics, the force of that bureau being augmented by an addition of 23 employees out of a total of 35 new positions for the entire Department. The administrative organization of the Department, that is, the working force of the Office of the Secretary, including the Chief Clerk's office, the Disbursing Office, the Division of Conciliation, the Division of Publications and Supplies, the Appointment Division, and the mechanical, watch, and labor forces of the Department, received only 9 additional positions.

There is an apparent increase in the nonstatutory positions to the number of 1,723. This increase was mainly in the United States Employment Service. A very large majority of these employees are paid only a nominal salary, however, being State, county, or

municipal officers cooperating with the Employment Service. The total increase in all positions, statutory and nonstatutory, including those receiving a nominal salary, is 1,975 over the year ended June 30, 1918. As compared with the previous year this increase is slightly over 82 per cent.

Total number of officials and employees in Department of Labor, July 1, 1919.

Bureau or office.	Statutory.	Non-statutory.	In District of Columbia.	Outside District of Columbia.	Total July 1, 1919.	July 1, 1918.	Increase(+) or decrease(—) during year.

Information and Education Service.....					302	302
Investigation and Inspection Service.....					64	64
Woman in Industry Service.....	4			4	26	30
Training and Dilution Service.....	2			2	154	156
Working Conditions Service.....	3			3	17	20
Labor Adjustment Service.....					1	1
Total.....	1,080	48	29	1,157	11,507	12,664

There was a total of 12,664 appointments during the year. This number includes every case in which an appointment certificate was issued. It will be observed that of this number there were 11,507 temporary appointments. In many cases this figure includes short-term appointments, a large number of which were extensions, each action being considered an appointment, due to the fact that the same procedure was required in making an extension as in issuing a new appointment.

Separations and changes.—There were 6,150 separations from all classes of positions. This figure indicates a very heavy turnover. However, the records show that a large number of employees were appointed for a short temporary period, and necessarily “separated” at the conclusion of the term. Many of these employees were appointed and separated five or six times during the year.

Separations and miscellaneous changes in personnel.

Bureau or office.	Separations.					Grand total.	Miscellaneous changes.
	From permanent positions.				From temporary positions.		
	Competitive.	Excepted.	Unclassified.	Total.			
Office of the Secretary	36		4	40	16	56	152
Commissioners of Conciliation					47	47	90

DISBURSING CLERK.

Functions.—The disbursing clerk prepares requisitions for public funds from appropriations for the Department. He also pays its obligations and does the general accounting of the Department. Naturalization fees and moneys received by the Secretary of Labor from aliens in lieu of bond are accounted for by him.

Appropriations.—For the fiscal year ended June 30, 1919, the appropriations by Congress to the Department and its services and the allotments made by the President to the Department from the appropriation of \$100,000,000 provided for the national security and defense by the deficiency act approved April 17, 1917, were as follows:

Salaries, Office of the Secretary of Labor.....	\$128,200.00
Salaries and expenses, commissioners of conciliation.....	200,000.00
Contingent expenses, Department of Labor.....	50,496.79
Contingent expenses, Department of Labor (certified claims).....	14.81
Contingent expenses, Department of Labor, 1918.....	10,000.00
Contingent expenses, Department of Commerce and Labor (certified claims).....	2.76
Rent, Department of Labor	24,000.00
War Emergency Employment Service.....	5,772,000.00
Advanced transportation, United States Employment Service, 1918-19.	250,000.00
National security and defense, Department of Labor:	
Cost of living.....	325,000.00
Work of Children's Year.....	150,000.00
Investigation of child labor.....	100,000.00
Industrial surveys.....	300,000.00
Passport permits.....	500,000.00
Mediation.....	560,000.00
Labor allotment.....	10,000.00
War Labor Administration:	
Conciliation.....	326,393.11
Information and Education Service.....	225,000.00
Investigation and Inspection Service.....	300,000.00
Personnel.....	15,000.00
Secretary's Office.....	110,000.00
Training and Dilution Service.....	150,000.00
Woman in Industry Service.....	40,000.00
Working Conditions Service.....	45,000.00
Printing and binding (all services).....	150,000.00
Salaries, Bureau of Labor Statistics.....	172,960.00
Miscellaneous expenses, Bureau of Labor Statistics.....	70,000.00
Library, Bureau of Labor Statistics.....	300.00
Salaries, Bureau of Immigration.....	88,340.00
Expenses of regulating immigration.....	2,450,000.00
Immigration Station, Ellis Island, N. Y.....	170,000.00
Expenses of regulating immigration (advertising).....	11.85
Expenses of regulating immigration (certified claims).....	122.15
Refunds:	
Cunard Steamship Co. (Ltd.).....	75.00
Hartfield, Solari & Co.....	160.75
Scandinavian-American Line.....	70.50
Head tax.....	648.00

Payment to Mauro Fierro.....	\$125. 00
Salaries, Children's Bureau.....	102, 040. 00
General expenses, Children's Bureau.....	94, 000. 00
General expenses, Children's Bureau (certified claims).....	101. 00
Enforcement of the child-labor law.....	125, 000. 00
Investigation of child welfare, Children's Bureau.....	72, 120. 00
Salaries, Bureau of Naturalization.....	97, 010. 00

Court costs.....	77. 95
Government property.....	351. 35
Total.....	1, 052, 217. 25

Bureau of Naturalization:

Naturalization fees.....	\$387, 957. 59
Interest on naturalization fees.....	162. 09
Total.....	388, 119. 68

Miscellaneous:

Proceeds of sale of Government property.....	14, 589. 23
Total.....	1, 455, 026. 79

Unexpended balances.—In accordance with the act of Congress of June 20, 1874 (18 Stat. L, 110, 111), the following unexpended balances of appropriations were covered into the surplus fund of the Treasury Department June 30, 1919:

Library, Bureau of Labor Statistics, 1917.....	\$22. 68
Contingent expenses, Department of Labor, 1917.....	48. 00
Salaries, Bureau of Immigration, 1917.....	3. 71
Miscellaneous expenses, Bureau of Naturalization, 1917.....	24. 25
Total.....	98. 64

THE BUREAUS.

BUREAU OF LABOR STATISTICS.

Origin and history. —The Bureau of Labor Statistics, the oldest of the bureaus in the Department of Labor, was authorized by an act approved June 27, 1884, nearly 30 years before the creation of the Department. Under this act a "Bureau of Labor" was created in the Department of the Interior.

It was formally organized January 1, 1885. In 1888 this Bureau of Labor was separated from the Department of the Interior and made an independent department, under the title "Department of Labor," with a Commissioner of Labor as its chief, who, however, not being of secretarial rank, was not a member of the President's Cabinet.

In 1903 this "Department of Labor" was placed under the Department of Commerce and Labor, as the Bureau of Labor, its original designation. It became a part of the Department of Labor, under the title of the Bureau of Labor Statistics, on the creation of the Department in 1913.

The organization of the Bureau of Labor Statistics was the first response to an appeal by wage earners, urged for more than 20 years throughout the country and in Congress, that there be created a department in the Federal Government to look after their interests. The Bureau of Labor Statistics is the nucleus around which the Department of Labor has been built up. Its functions are now and always have been almost wholly statistical and educational.

The Monthly Labor Review. —To convey more accurately the nature of the publication, the name of the Monthly Review, established by the bureau in 1915, was changed with the July, 1918, issue to the Monthly Labor Review.

In the four years of its publication this magazine has proved its usefulness as a medium for the dissemination of authoritative labor news, and its scope has been greatly enlarged. The Review carries each month articles on the current work of the Bureau of Labor Statistics and summaries of the reports and activities of all other Government agencies, both Federal and State, which have to do with labor. In addition to the monthly presentation of statistics of immigration and of a summary of the conciliation work done by the Department, reports of the work of the various State labor bureaus and other State agencies dealing with labor and complete summaries of the important new legislation, court decisions, and administrative orders affecting labor, are given to the public promptly. Special attention is given to up-to-date information on wholesale and retail prices and cost of living; wages and hours of labor; minimum wage; women in industry; employment and unemployment; labor turnover; conciliation, mediation, and arbitration; strikes and lockouts; collective

bargaining; employees' representation; cooperation; profit sharing; labor organizations; industrial accidents; industrial poisons and diseases; workmen's compensation and social insurance; labor legislation; vocational education; rehabilitation of injured men; housing and welfare work. The various reconstruction programs, both domestic and foreign, and various phases of reconstruction work receive the consideration their importance merits.

Publications other than Monthly Labor Review.—At the end of the fiscal year 1919, besides the 12 numbers of the Monthly Labor Review, there had been received from the Government Printing Office 13 bulletins. Two other bulletins were completed but had not been issued. The 25 publications issued contained 7,045 pages of printed matter, 93 illustrations, 22 diagrams, 26 charts, 13 line drawings, and 1 text chart.

The bulletins are published in series according to subjects and are numbered consecutively. A list of the series is as follows:

- Wholesale prices,
- Retail prices and cost of living,
- Wages and hours of labor,
- Employment and unemployment,
- Women in industry,
- Workmen's insurance and compensation (including laws relating thereto),
- Industrial accidents and hygiene,
- Conciliation and arbitration (including strikes and lockouts),
- Labor laws of the United States (including decisions of courts relating to labor),
- Foreign labor laws,
- Vocational education,
- Labor as affected by the war,
- Miscellaneous series.

In addition the bureau prepared and supervised the printing for the United States Employment Service, of a series of 13 pamphlets containing 659 pages, giving descriptions of occupations in some 22 industries and groups of industries.

During the year the bureau has accumulated and classified much material relating to the war, done a great deal of research work at the request of the War Labor Policies Board, supplied information requested by Members of Congress and other persons interested in labor matters, and prepared and printed many bibliographies relating to labor subjects. It has also carried on a systematic correspondence with the various State labor bureaus and other State agencies dealing with labor, thus bringing about closer cooperation with the States. Through the work of a special representative in Great Britain the bureau has been able to publish special information regarding labor developments in Great Britain.

Reports transmitted but not published.—In addition to the 25 publications issued (13 bulletins and 12 numbers of the Monthly Labor Review) and 2 bulletins which were completed but not issued, there were 12 in course of preparation. The 14 bulletins not issued relate to international labor legislation and the society of nations; labor legislation of 1918; preventable death in the cotton manufacturing industry; wages and hours of labor in the slaughtering and meat-packing industry; joint standard industrial councils in Great Britain; accidents and accident prevention in machine building; decisions of courts and opinions affecting labor, 1918; union scale of wages and hours of labor, May 15, 1918; wages and hours of labor in the boot and shoe industry, 1907 to 1918; wages and hours of labor in woolen and worsted goods manufacturing, 1918; wages and hours of labor in cotton goods manufacturing and finishing, 1918; housing by employers in the United States; proceedings of fifth annual meeting of the International Association of Industrial Accident Boards and Commissions, held at Madison, Wis., September 24-27, 1918; preliminary report of industrial survey in selected industries in the United States, 1919.

BUREAU OF IMMIGRATION.

Origin and functions.—This bureau was established by the immigration act of March 3, 1891, as the "Office of the Superintendent of Immigration." The title of Superintendent was changed to "Commissioner General of Immigration" by the act of March 2, 1895. That official served under the Secretary of the Treasury until 1903, when the Bureau of Immigration was made a part of the newly created Department of Commerce and Labor. It was finally made a part of the Department of Labor upon the organization of the latter in 1913. The duties of the bureau are primarily connected with the enforcement of the immigration and Chinese-exclusion laws. It is also charged, under the immigration act of February 5, 1917, with the examination and registration of all alien seamen arriving in United States ports. Prior to the creation of the United States Employment Service as a separate organization, that service was under the bureau's direction, but the business activities in that field are now limited to those of the Division of Information, which the law provides shall "promote a beneficial distribution of aliens." Throughout the period of the war the bureau rendered much special service to the Government, both under its own authority and in cooperation with other branches of the Government charged with the enforcement of war measures.

The following is a summary of some of the regular and special duties performed by the bureau during the past fiscal year:

GENERAL IMMIGRATION.

Summary of arrivals and exclusions.—The following statement summarizes the totals of arrivals, exclusions, and admissions of aliens for the fiscal year ended June 30, 1919:

Arrivals of aliens, July 1, 1918, to June 30, 1919.....	245, 647
Detained for special inquiry.....	39, 636
Admitted on primary inspection.....	206, 011
Detained for special inquiry.....	39, 636
Rejected by boards of special inquiry.....	5, 487
Admitted by boards of special inquiry.....	29, 929
Appeals.....	4, 140
Petitions for bonding.....	33
Petitions for hospital treatment.....	43
Petitions for transit privilege.....	3
Petition for admission until termination of war.....	1
Cases before Secretary of Labor.....	4, 220
Rejected by Secretary of Labor.....	3, 139
Admitted by Secretary of Labor:	
On appeal without bond.....	807
On bonds.....	234
For hospital treatment.....	36
For transit privilege.....	3
Until termination of war.....	1
Total.....	1, 081
Aliens admitted.....	237, 021
Aliens excluded.....	8, 626
Total alien arrivals.....	245, 647
Ratio of admissions to arrivals, 96.5 per cent.	
Ratio of exclusions to arrivals, 3.5 per cent.	

ALIEN ARRIVALS AND DEPARTURES.

As compared with the previous year, the fiscal year just closed shows a slight increase in immigration.

Tabulation.—The following statement gives some of the more important items of statistical information, to be found in much greater detail in the report of the Commissioner General of Immigration:

Arrivals (admitted):	
Immigrant aliens.....	141, 132
Nonimmigrant aliens.....	95, 889
Total.....	237, 021

Previous year:

Immigrant aliens.....	110, 618	
Nonimmigrant aliens.....	101, 235	
		<u>211, 853</u>

Increase or decrease:

Immigrant increase.....	30, 514	
Nonimmigrant decrease.....	5, 346	
Net increase.....		<u>25, 168</u>

Departures:

Emigrant aliens.....	123, 522	
Nonemigrant aliens.....	92, 709	
Total alien departures.....		<u>216, 231</u>

Previous year:

Emigrant aliens.....	94, 585	
Nonemigrant aliens.....	98, 683	
		<u>193, 268</u>

Increase or decrease:

Emigrant increase.....	28, 937	
Nonemigrant decrease.....	5, 974	
Net increase.....		<u>22, 963</u>

Increase in alien population, 1918 and 1919:

Arrivals (1918).....	211, 853	
Departures (1918).....	193, 268	
Net increase (1918).....		18, 585
Arrivals (1919).....	237, 021	
Departures (1919).....	216, 231	
Net increase (1919).....		20, 790
Increase in population in 1919 more than in 1918.....		2, 205
Increase in aliens admitted, 11.4 per cent.		
Increase in net addition to population, 12.2 per cent.		

Age of admitted immigrant aliens:

Under 16 years.....	26, 373	
16 to 44 years.....	97, 341	
45 years and over.....	17, 418	
Total.....		<u>141, 132</u>

Literacy of admitted immigrant aliens:

Total 16 years or over.....	114, 759	
Unable to read or write.....	2, 827	
Able to read but not write.....	443	
Illiterate (over 16 years of age).....		<u>12, 827</u>
Literate (over 16 years of age).....		111, 932

Illiterate, 2.6 per cent.

Financial ability.—There were shown to inspection officers by immigrant aliens admitted sums of money aggregating \$15,831,247, or an average of \$112 per person. About 42 per cent of those able to prove possession of money had less than \$50 each, 79,646 claimed to

¹ Admissible under exemptions provided by section 3 of the immigration act.

have paid their own passage, 49,773 admitted that their passage had been paid by relatives, and 11,713 that it had been paid by persons other than relatives.

Ages and periods of residence of departing aliens.—During the year 123,522 emigrant aliens left the United States. Of these, 60,731 had resided in the United States less than 5 years, 53,579 from 5 to 10 years, 5,610 from 10 to 15 years, 1,677 from 15 to 20 years, and 1,925 over 20 years. As to ages, 7,352 were under 16, 86,006 were from 16 to 44, and 30,164 were 45 years of age or over.

Exclusion of arriving aliens.—On account of the abnormal conditions during the past four years it is difficult to make comparisons with previous years. Exclusions in 1913 amounted to 1.38 per cent, in 1914 to 2.3 per cent, in 1915 to 5.3 per cent, while during the years 1916, 1917, and 1918 they were 4.9, 4.2, and 3.3 per cent, respectively. The past fiscal year shows a percentage of 3.5. As to numbers excluded, there were 24,111 for 1915, 18,867 for 1916, 16,028 for 1917, 7,297 for 1918, and 8,626 for 1919.

The following table shows the principal causes of rejection for the years 1910 to 1919, inclusive:

Cause of rejection.	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919

Alien enemies.....									49	40

Reasons for exclusion.—It will be observed from the foregoing table that "likelihood of becoming a public charge" continues to be by far the most important single cause of rejections, about 46 per cent of those turned back at the ports being under that head. Illiteracy was second in importance as a cause of rejections during the past year as well as in 1918—the only years in which the "illiteracy test" in the new law has been in full operation.

Expulsion of aliens.—There have been expelled from the country under departmental process during the past year 3,068 aliens, com-

pared with 1,569 in 1918. The 3,068 expelled during the year are divided as follows with respect to causes of expulsion:

In the country five years or less:

Members of excluded classes at time of entry.....	2, 257
Became public charges from causes existing prior to entry.....	257
Violation of Chinese-exclusion laws.....	47

In the country three years or less:

Entered without inspection.....	183
---------------------------------	-----

Aliens whose deportation is compulsory without regard to the length of time they have been in the country:

Sexually immoral.....	162
Anarchists.....	35
Criminals.....	127

Total deportations.—Adding together the 8,626 aliens excluded at the ports and returned to countries of origin, the 3,068 arrested and expelled from the country, and the 34 Chinese aliens whose deportation was ordered by courts or commissioners under the exclusion laws, it is shown that the total number of aliens deported during the year was 11,728, compared with 8,916 in 1918. In addition to the foregoing, there were arrested during the year, 637 aliens whose deportation was impracticable on account of war conditions. At the beginning of the fiscal year a plan was adopted which enabled the Department to release from custody aliens whose immediate deportation was impossible, as well as those deemed worthy of an opportunity to demonstrate their fitness to remain in this country. The plan provides that such aliens shall remain under the supervision of immigration officers, and that a percentage of their earnings shall be deposited at regular intervals in postal savings banks, such deposits being returned with accrued interest when the cases are closed by the deportation or final release, as the case may be. During the year the Department released 154 aliens under the provisions of this rule.

IMMIGRATION FROM INSULAR UNITED STATES.

Statistics of the movement of aliens from insular United States to continental United States were published for the first time in 1914, but the record is available since 1908. During the entire period a total of 29,138 have come to the mainland from all the insular territory. Of these 19,311 came from Hawaii; 8,559 from Porto Rico; 1,017 from the Philippines, and 251 from the Virgin Islands. During the past year 2,398 such aliens have been admitted to the mainland, of whom 1,305 came from Hawaii; 806 from Porto Rico; 180 from the Philippines, and 107 from the Virgin Islands. Formerly this movement of aliens from insular territory was a somewhat troublesome problem, but this was largely solved by the immigration law of 1917, which makes such aliens, as well as aliens passing

from one island to another, subject to the same examination as aliens coming from a foreign country. This does not apply to citizens of the islands, however, for they are not regarded as aliens. The commissioner of immigration at San Juan has experienced some difficulty in connection with aliens passing between Porto Rico and the Virgin Islands, and he has recommended that, in view of the proximity of these two, they be not regarded as foreign to each other in this respect; but this, of course, can not be done under existing law.

INDUCED AND ASSISTED IMMIGRATION.

The problem of induced and assisted immigration, which in prewar years was a serious one, gave little trouble during the year, but it is probable that former conditions will be revived. However, the new immigration law will afford a more satisfactory means of dealing with the problem than previous laws.

CONTRACT LABOR.

The number of contract labor cases which came to the attention of the bureau was unusually large, but they were of such a nature that legal proceedings against importers were instituted in only three cases during the year. However, investigations of many reported or suspected violations have been made, and 69 aliens who were found to have entered the country in violation of the contract labor clause were deported, as compared with 33 during the fiscal year 1918. During the year 774 alien contract laborers arriving at United States ports were denied admission as compared with 474 in 1918. It has always been possible under the law to import skilled laborers provided unemployed laborers of like kind could not be found in this country, but the immigration act of 1917 goes a step farther and provides that the necessity for importing such labor may be determined by the Secretary of Labor before importation is made. The law stipulates that permission to bring in laborers under this provision may be granted only after a hearing and investigation into each case, and such investigations have formed an important part of the work of the contract-labor division during the year. Concrete examples of the operation of the new law are found in certain Canadian border cases, where it has been a long established custom for employers to bring more or less skilled laborers from Canada for seasonal work. Formerly these cases occasioned much trouble. Many suits were instituted against importers but convictions were infrequent and the practice persisted. Under the new law, however, some employers who practically ignored the contract-labor law, are required first to present applications to the Department. On the whole, results have been satisfactory, although a more general observance of the rules would still save much embarrassment and delay and enable many applicants to avoid useless trips

to this country. Too often the blame is placed upon the Government when it should be borne by the importer.

IMPORTATION OF LABORERS FOR WAR NECESSITIES.

The principle alluded to under the heading of contract labor was utilized in a much broader way through the temporary admission during the fiscal year of 20,643 Mexicans and a smaller number of Bahama Island negroes for emergency labor during the war. This was accomplished under authority of section 3 of the law of 1917, which confers upon the Secretary of Labor discretionary power to admit temporarily aliens who are otherwise inadmissible. This waiver was strictly a war measure and met a labor need which could not have been supplied otherwise. The privilege was terminated at the close of the calendar year 1918, except with regard to certain classes of farm laborers. The existing arrangement as to these continued until the close of the fiscal year.

ORIENTAL IMMIGRATION.

Chinese immigration.—Only a comparatively small number of Chinese applied for admission during the year, the number admitted and rejected being 1,697 and 172, respectively, while 112 Chinese found to be unlawfully in the country were deported. The total number of immigrant and nonimmigrant Chinese, and those in transit through the United States to a foreign country, was 7,426, and the number of emigrant and nonemigrant aliens and transients departing from the country was 7,930, showing a net decrease of 504 in the Chinese population through immigration and emigration. The number of Chinese granted transit privileges during the year was 5,041, compared with 34,977 in 1918, of whom 28,838 were destined to France for war work. The Circuit Court of Appeals for the Ninth Circuit has rendered a decision (*Quan Hing Sun et al. v. White*, 254 Fed., 402) holding that Chinese persons who apply for admission to the United States and are rejected on primary inspection are entitled to an examination before a board of special inquiry—a privilege which is granted to all rejected aliens by the immigration law, but not by the Chinese-exclusion law. This decision has enabled the Department to take a long desired step in the direction of bringing the procedure in the cases of Chinese applicants into harmony with that followed in the cases of aliens generally. It is believed that good results will follow, through the assurance of fair and just hearings to all applicants and the prevention of delays in the adjudication of cases.

Japanese immigration.—During the year 10,056 Japanese immigrant aliens were admitted, as compared with 10,168 admitted in the previous year, while 171 were debarred and 137 deported after landing as compared with 201 and 52, respectively, in 1918. In the present fiscal year 4,848 nonimmigrant Japanese were also admitted, so that

the total admissions of this race, including immigrants and nonimmigrants, aggregated 14,904, and the number of departing, including emigrant and nonemigrant aliens, was 11,233, making the indicated increase in population 3,671.

Asiatic barred zone.—There have been very few applications for admission from the portions of Asia and islands adjacent thereto the native population of which is excluded under the immigration law of 1917. Of those applying, 19 were excluded and 11 found in the country in violation of the law were deported. India is within the barred zone and during the fiscal year only 171 were admitted from that country, including 68 East Indians or Hindus.

Smuggling over borders.—During the war Chinese and other inadmissible aliens were employed in war-material factories in Canada near the international boundary. Following the signing of the armistice practically all of the Chinese were dismissed from this employment and some sought surreptitious entry into the United States. During the war the border was so closely guarded by both Canadian and United States military authorities as well as by our immigration officers that the smuggling of aliens was practically impossible; but with the withdrawal of the military, the meagerness of the force of immigrant inspectors available for prevention of smuggling made it possible for some Chinese to gain illegal entry. However, a number of smugglers were caught in the act of bringing in Chinese illegally and every possible effort is being made to guard the border against further violations of the exclusion law. Chinese laborers continue to pass in transit to the West Indies, and there are substantial reasons for believing that the object of many of these is unlawful entry into this country.

The limiting of Japanese immigration to Canada has reduced the probabilities of any considerable movement of that race across the northern boundary. But unfortunately the same condition does not exist on the Mexican frontier, and some inadmissible Japanese gain entrance over that border. Investigations made during the year exposed a well-organized plan to circumvent the immigration law by Japanese laborers coming to Mexico, either direct from Japan or via Central and South American countries, for the purpose of gaining illegal entry into the United States at points along the southern California-Mexican border. During the investigation 37 persons implicated in the illegal importation of Japanese laborers were arrested, some of whom have already been convicted and given substantial penitentiary sentences, and 117 contraband Japanese laborers were apprehended and deported.

It is very strongly recommended that ample funds be provided for a patrol service to guard the borders, coast lines, and the insular territory against smuggling. The Department now has a small force

doing effective work, but this needs to be materially increased. The regular immigration officials, who are charged with the general enforcement of the immigration law, can not be expected to make the specialized effort necessary entirely to overcome the devious methods practiced by those who seek to enter the country surreptitiously. This class of work needs experienced officers who are free to devote all their time and energies to the task. During the past year, it was possible for a time to patrol certain places on the Mexican border and the supervising inspector in charge of that district reports that more progress was made in enforcing the law than had been the case for the entire ten previous years. But unfortunately it was necessary to abandon much of this specialized work because the available funds were exhausted. Until such a patrol is permanently reestablished with an adequate personnel, the Immigration Service can not fully meet the requirements of the law.

WAR ACTIVITIES.

By reason of the special training and experience of its officers the bureau was in a position to render important service in many outside lines of activity during the war, and the executives of the Departments of State, Treasury, War, Navy, and Justice have generously acknowledged its cooperation in carrying out various war measures. Under the act of May 2, 1918, entitled "An act to prevent in time of war departure from and entry into the United States contrary to the public safety," by direction of the President immigration officials were designated as control officers for incoming travel at all ports of entry, for outgoing travel on the land boundaries, and as permit agents for the examination of resident aliens seeking to leave the United States. The system of control authorized by this act went into effect September 15, 1918, superseding the joint order of July 26, 1917, referred to in the bureau's report for last year. During the period September 15 to June 30, 171,995 permits were granted to aliens to leave the country, and 4,119 applications for such permits were denied. At the close of the year 1,173 applications were pending, and in 3,477 other cases the permits were not claimed or applications were withdrawn. Identity cards for travel between the mainland and outlying possessions were furnished to 8,632 United States citizens, and 35,610 aliens' and 15,775 citizens' permits to cross the Mexican border were also issued. Practically every case required painstaking investigation and the work entailed much correspondence and clerical labor.

The War Department on July 1, 1918, assumed charge of interned enemy aliens, a task which the Department of Labor had previously performed; but the bureau expended much effort during the year in

determining the status of such aliens under the immigration law and taking action respecting the deportation of those found to be in the country unlawfully. Immigration officials throughout the country were able to render valuable assistance in the enforcement of the espionage, trading with the enemy, and sabotage laws. Another important duty undertaken was that of preventing the departure over land boundaries of men of military age not in possession of permits to leave the country. On the Mexican border 639 offenders were arrested. Investigations were made in nearly 2,000 cases of persons suspected of being deserters from the Army or evaders of the selective service law. A corresponding amount of work of this nature was also performed on the Canadian border. The provost marshal general has officially expressed his appreciation of the cooperation.

SEAMEN.

The immigration act of February 5, 1917, opened the way for a more adequate control of alien seamen arriving at United States ports than had hitherto been possible, and perhaps the largest single item of work performed by field officers during the year was in this connection.

The Department is gratified to note that the year's experience has confirmed its opinion that the problem of arriving seamen could be regulated so as not to interfere with their traditional rights and at the same time prevent diseased, criminal, or other inadmissible aliens from coming to the United States in the guise of seamen for the purpose of surreptitious entry. As the result of experience in the year 1918 the rules were revised and new methods introduced for work in the field. Under the present practice it is possible to segregate alien seamen for compulsory treatment in hospitals. Fellow workers on vessels are thus given protection against contagion, while segregation on ship-board eliminates a further danger from close association with diseased shipmates. Under the new practice all alien seamen arriving in United States ports are medically examined each time they arrive, the examination being similar to that made in the case of alien passengers. Identification cards are furnished to each seaman and many precautions are taken to prevent the spread of disease as well as unlawful entries. The great work entailed is indicated by the fact that during the fiscal year 810,097 seamen were examined, 261,551 identification cards were issued, and 4,053 seamen were certified for loathsome or dangerous contagious diseases and removed to hospitals for treatment. The amount of the work necessary will be more fully appreciated when it is understood that the examination of a seamen consumes more time than is required in the inspection of an immigrant. Owing to this added duty immigration officials were required to examine a total of 1,055,744 arrivals during the fiscal year, or only a little less than the average

number of immigrants examined during the 15 years of heavy immigration prior to the outbreak of the World War.

Arrangements should be perfected whereby the masters of vessels can be furnished by the American consular officers at foreign ports of departure with a supply of seamen's identification cards in blank, with full instructions concerning their proper use and the necessity that every member of the vessel's crew shall upon arrival at a United States port have in his possession an identification card properly made out and bearing his photograph. This procedure would materially reduce the time required for the examination of crews, with a corresponding elimination of delay to vessels when it is necessary to do this work after arrival. If blanks were supplied through consular officers proper crew lists might be promptly furnished to immigration officials on arrival and there would be no necessity for the imposition of fines on masters of vessels for failure to deliver such documents.

But while good has resulted to seamen under the new order of things, the seamen's law gives arriving seamen the right to leave their ships and makes it possible for them to enter the country without examination by immigration officers. The law provides that seamen desiring to remain in the country must present themselves for proper examination under the immigration law. Many do this, but more do not, and while many of the latter would be regularly admitted on examination, it is certain that many excludable persons choose this method of gaining illegal entry. It is apparent that a follow-up system is necessary in the case of deserting seamen who do not apply promptly for admission. This branch of the work should be delegated to the special patrol service previously recommended.

ADMINISTRATIVE FINES.

During the year the sum of \$58,055 was assessed against transportation companies in administrative fines, the largest aggregate amount so assessed (\$30,650) being on account of the failure of masters, owners, or agents of vessels to furnish the information required by section 36 with regard to alien crewmen. Other causes for which penalties were assessed were as follows: Bringing of illiterate aliens, \$12,400; bringing aliens who were diseased or defective, or otherwise inadmissible as specified in section 9, \$9,375; bringing such aliens as members of crews, \$450; failure to furnish proper manifest data as to alien passengers, \$2,180; failure to deport, detain on board, or pay detention expenses of excluded aliens, \$3,000.

Some difficulty has been encountered in connection with refunds of passage money to excluded aliens because of inability to locate the aliens at the foreign addresses given by them at the time of their rejection. Steps to remedy this condition are now under consideration.

A CENTURY OF IMMIGRATION STATISTICS.

The so-called passenger act of March 2, 1819, was not only the first United States law for the protection of passengers at sea but its requirement that the age, sex, and occupation of each person carried should be reported to customs officials at ports of arrival marked the beginning of our official statistics respecting immigration. Reference to this early law brings out the interesting fact that the record to the end of the fiscal year 1919 covers a period of one hundred years. Details concerning this earlier immigration seem very meager compared with the elaborate records provided for in more recent legislation, but the statistics as a whole afford a highly interesting picture of the immigrant tide during the century and the extent to which various peoples contributed to the total.

The number of aliens who came prior to the fiscal year 1820 has been variously estimated, but no authentic record has been preserved. It is said that there was an unprecedented influx in the years following the second war with Great Britain, and it is known the sufferings of these immigrants on greatly overcrowded ships was a potent argument for the enactment of the law of 1819. From 1820 to 1830 the average annual influx was only about 14,000, but it increased to an average of 60,000 in the decade 1831-1840; to 171,000 in 1841-1850; and to nearly 260,000 in 1851-1860; the two last-mentioned decades marking the beginning and rise of great movements from Ireland and Germany. The annual average fell to about 231,000 during the Civil War decade; rose again to 281,000 in 1871-1880, and reached the great height of nearly 525,000 annually in 1881-1890. This was the last wave in which immigration from northern and western Europe was in the majority, and even then the peoples of southern and eastern Europe were a close competitor. Industrial depression in the United States was largely responsible for a decrease to an annual average of approximately 369,000 in the decade 1891-1900, but in the 10 years following, 1901-1910, it reached the enormous average of nearly 880,000 a year. But the average accession was even greater during the first four years of the present decade, for in 1911-1914 it reached 1,033,283 annually. But war again intervened and the annual average fell to 234,536 in 1915-1919. In 1918 immigration reached the lowest level since 1862.

During the past century 33,200,103 aliens are recorded as having entered the country, of whom 8,206,675, or 24.7 per cent of the whole, came from the United Kingdom. Germany followed with 5,494,539, or 16.6 per cent. Then comes Italy with 4,100,740, or 12.4 per cent; Russia, 3,311,400, or 10 per cent; and the Scandinavian countries, 2,134,414, or 6.4 per cent, leaving a balance of 5,884,887, or 17.7 per cent, who came from other countries. Until

1882, when the first general immigration law was enacted, the ingress of aliens was almost unregulated. Some of the seaboard States made attempts to control the multitudes passing through their ports, but the courts usually held that such laws were unconstitutional on the ground that they attempted regulation of foreign commerce. During the great immigrant years in the forties and fifties there was considerable agitation in Congress for restrictive or selective laws, but except for an act aimed at the importation of Chinese prostitutes (enacted in 1875), the Federal Government made no attempt at regulation until 1882.

The law of 1875 excluded only women imported for the purpose of prostitution and convicts undergoing sentence for a crime not growing out of a political offense, but succeeding laws added to the list of undesirables until at present about 30 more or less distinct classes of aliens are denied admission to the country.

FUTURE IMMIGRATION.

The present is an appropriate time for reviewing the world emigration and immigration situation, so far as it may affect the United States. First considering the situation in Europe, which has been and undoubtedly will continue to be the chief source of our immigration, we may trace the development and explain the present status of immigration from Asia and from the neighboring countries of the Western Hemisphere.

The European situation.—During the century for which records of our immigration are available approximately 89 per cent of our immigrants came from Europe, 2.4 per cent from Asia, and somewhat less than 9 per cent from other countries, chiefly Canada and Mexico. Numerically, therefore, Europe is by far the most important of all sources. It is a familiar story that up to about 35 years ago the bulk of European immigration originated in the northern and western countries. The sources gradually shifted to southern and eastern countries. In 1907 the influx reached its highest point, and the latter furnished more than three-fourths of all arrivals from Europe as compared with less than 11 per cent 25 years earlier, in 1882. It is an equally familiar fact that while a large part of the earlier immigrants went to the land and were widely distributed in this country, those coming from southern and eastern Europe became in the main workers in cities and industrial districts. The older immigrants came mostly in family groups and settled permanently in this country. Later immigration was largely a movement of men without families, many, perhaps a majority, returned to their native lands after a few years of labor here. The widespread alarm over the great influx; the persistent demand for restriction; the efforts of Congress

to prevent the coming of the criminal and the diseased; the finding of the United States Immigration Commission in 1910 that immigration had greatly overstocked the unskilled labor market; the similar findings by the Commission on Industrial Relations; and, finally, the adoption of the "illiteracy test" in 1917, in the belief that it would reduce the number of laborers coming to our shores—these are all occurrences of the last generation.

Coming to the highly important, but obviously difficult subject of the probable trend of European immigration after the war, many phases of the situation must be taken into account. The history of our past immigration affords no really reliable guide by which to predict what effect the World War may have on the future flow from the various countries. Lack of statistical data prior to 1820, makes it impossible to observe in detail the influence the Napoleonic wars, and our second war with Great Britain had upon immigration, but it is recorded that they were followed by a sudden rush which reached the number of 17,000 in 1817. It is also worth noticing that most of them came from a country with which we had recently been at war. On the other hand, the immigration decreased following the Crimean War, but this was undoubtedly due to causes other than that conflict.

The Franco-Prussian war seems to afford safer ground for comparison with the present situation. The German immigration fell from 131,000 in 1869 and 118,000 in 1870 to 82,500 in the war year of 1871, but rose again to more than 140,000 in 1872 and to nearly 150,000 in 1873; while defeated France, which sent us an annual average of only 3,600 immigrants in the three years 1869–1871, sent an average of 11,250 during the three years following the conflict. These figures make it appear that in this instance at least, war, regardless of victory or defeat, may have been an actual incentive to immigration. The Franco-Prussian war came in the midst of a great transoceanic movement of the German people, and it is a notable fact that even the attractions of a victorious and united Germany were insufficient to hold the population, for the egress continued and increased until 11 years later it reached more than a quarter of a million souls in a single twelvemonth.

Immigration from Italy, Austria-Hungary, and Russia, not to mention Greece and the Balkans, had reached a stage at the outbreak of the present war which closely corresponded to the case of Germany in 1871. That is to say, immigration from those countries was at flood tide and promised to so continue for years. Consequently, if this analogy may be trusted, we may expect a repetition of the German experiences unless, of course, artificial barriers are interposed by the countries themselves, by the United States, or by factors that have not been taken into consideration, but there is another highly impor-

tant element which then affected German immigration only to a limited degree but which must be considered in connection with the present situation. That is the greatly disturbed political condition in which central and eastern Europe finds itself as the result of war. This factor if long continued may have a powerful influence upon future immigration from such sources.

Economic pressure and political unrest and oppression are potent promoters of immigration. The first, of course, accounts for the greater part of the enormous movement from Europe to the New World, but the importance of the German revolution of 1848 in this regard must not be overlooked, nor can we forget that oppression, as well as economic reasons, was behind the great Jewish influx from Russia and Roumania. In the existing situation disturbed economic and political conditions both prevail over a great part of Europe. It is a historical fact that emigration from Germany practically ceased with the stabilization of economic conditions there; but the close of the present war finds that country in the midst of an economic as well as a political crisis, and these conditions may operate to reestablish Germany as an important immigrant-furnishing country.

On the other hand, Germany lost upward of 2,000,000 men in the war, and this loss has appreciably diminished the age and occupational groups from which most immigration springs. Also the economic classes which are most prone to emigrate may see hope for themselves and their children in the changed political status of the fatherland and willingly endure the incidental hardships of reconstruction on that account. But it is reasonable to suppose that there are many of other classes in Germany, including army and navy officers, small capitalists and others, upon whom the burden of changed conditions will fall so heavily that they will resort to emigration for relief.

The situation in what was once Austria-Hungary is bewilderingly complicated, and it is difficult to say what the effect upon immigration may be. In 1914—and that year was fairly typical—10 races or peoples each contributed largely to the 244,000 who came from that empire. These included, in round numbers, 49,000 Poles, 43,700 Magyars, 35,000 Croats and Slovenes, 32,000 Ruthenians, 29,000 Germans, 25,300 Slovaks, 22,000 Roumanians, 20,400 Hebrews, and 9,300 Bohemians and Moravians. The former Polish population, and the Jews as well, are now mostly in reconstructed Poland; the Bohemians, Moravians, and Slovaks are in Czecho-Slovakia; the Croatians and Slovenians are largely transferred to the Kingdom of the Serbs, Croats, and Slovenes. Presumably most of the Roumanians and Ruthenians will also come under other sovereignties. Therefore, the population of the two countries is largely reduced to Germans and Magyars, the latter coming from Hungary proper. There are still many Jews in both countries, as well as remnants of other peoples

but the Germans and Magyars are overwhelmingly predominant. The German element in our Austro-Hungarian immigration has come largely from Hungary in recent years—86,000 out of a total of 122,000 in the five years 1910–1914. Although the boundaries of the Austria of the future are not definitely determined at this writing, it is certain that its population will be predominantly German, and the figures indicate that they have not emigrated to the United States in large numbers in recent years. However, the war has left Austria in a most distressing economic condition, and a people in economic distress almost invariably seeks relief through emigration. On the other hand, a large proportion of the population in what promises to be the new Austria is in the single city of Vienna, and as a rule the dwellers in great cities have not emigrated. As a matter of fact, the population of such cities is partly made up of people who went there from the country or smaller towns in preference to emigrating to another land. However, if Vienna under the new order of things is deprived of its former commanding commercial position in central and southeastern Europe, it may be expected that its population will seek refuge elsewhere. Whether the drift will be toward the United States or to other countries is uncertain. Political developments may also have an important effect on emigration from Austria, but the present situation affords little indication of what may be expected in that regard.

The population of Hungary proper is more rural than that of Austria and therefore more likely to emigrate, but what happens will probably depend largely upon the economic and possibly the political developments following peace. Hungary is primarily agricultural, and it is not believed that this industry was greatly demoralized during the war or by succeeding events. This being the case, it is not unreasonable to expect that when something like normal conditions are restored in central and western Europe, Hungarian agriculture will find itself in a highly favorable position, and this would normally act as a powerful restraint to emigration.

Turning to Russia a still more complex situation is found, and it is difficult to say what may be expected in the way of immigration from that country. For many years prior to the war Russia had been one of the chief sources of our immigration, but until about 1910 comparatively few real Russians had joined in the movement. In 1907, for example, when the influx from Russia reached an approximate total of 259,000, only 16,000 persons of the Russian race were among them, compared with, in round numbers, 115,000 Hebrews, 73,000 Poles, 5,000 Lithuanians, 14,300 Finns, and 13,500 Germans. In other words, the real Russians represented only about 6 per cent of the total. But in succeeding years the number increased until in 1913 about 48,500, or nearly 17 per cent of the total, were of that race.

Investigations made in the peasant villages of Russia that year showed that unless checked the movement would eventually increase to enormous proportions. At present Russia is in chaos and the final outcome can not be foreseen. Finland is now recognized as a political entity, and the same is true of Poland, so that the sources of perhaps a majority of the immigrants in the past are removed from Russian control; and so are the Baltic States, including Lithuania. South-western Russia, now familiarly known as the Ukraine was a source of much Hebrew and some Little Russian immigration. The remainder of European Russia, commonly known as Great Russia, is at the moment largely included in Soviet Russia. The latter section has furnished comparatively few immigrants up to date.

Italy has furnished more immigrants to the United States than any other country except the United Kingdom and Germany, and from the beginning the exodus has been economic. It is densely populated and owing to restriction of opportunity and the rapid growth of population enormous numbers have been forced to emigrate. The United States has attracted a majority of the trans-oceanic emigrants, but nearly as many have gone to South America and other parts of the new world, and large numbers have left Italy every year for a more or less permanent stay in various European countries. A considerable part of the movement to this country was only temporary, and returning immigrants from both North and South America have contributed considerably to the economic upbuilding of their mother country.

Immigrants from Greece averaged about 25,000 annually prior to the war, and an average of about 21,000 came during the years of 1915-1917, but it fell to 1,910 in the following year and to only 386 in 1919. As in the case of Italy, economic reasons account for practically all immigration from Greece, but there is no authentic information as to the effect war may have upon immigration from that country.

The Balkan States -Bulgaria, Serbia, Montenegro, and Roumania, have never contributed a large volume of immigration, the average for the seven years prior to the war being about 9,000 annually. The movement was considerably reduced during the Balkan wars of that period, but it never exceeded 16,100, the number reached in 1908. The Balkans have been in the midst of war for about nine years and it would be strange if resulting economic and political conditions did not impel emigration to an extent equal to if not greater than that occurring in normal times. The same may be said of Turkey in Europe, a territory which dwindled to small proportions as a result of the Balkan wars and may disappear altogether in the final settlement of the world conflict.

Turkey in Asia presents another example of a country which has contributed a considerable stream of immigration that included few

persons of the country's dominant race, for of the approximately 109,000 coming from that source in the eight years 1907-1914, only 6,000 were Turks, the predominant peoples being Armenians, Greeks, and Syrians. One hesitates, however, to predict what the future immigration of the real Turkish people may be.

Turning to the newly created countries of Poland, Czecho-Slovakia, and Jugoslavia, it is exceedingly difficult to estimate the part they may play in future immigration. The Polish people have long been an important factor in the influx from Europe, and from 1899, when immigration was first recorded by race as well as country of origin, up to the outbreak of the war, 1,402,695 Polish immigrants came to the United States. In fact, during that period they led all other peoples except the south Italians and Hebrews. Like most immigrants, the Poles came largely for economic reasons, but undoubtedly dissatisfaction with their political surroundings was also an incentive and it remains to be seen whether the realization of their long dream of a restored Poland will keep them at home in the future. The future of Polish immigration will depend very largely upon the economic progress of the reestablished nation. The same argument is applicable to the Slovaks, who, as subjects of Hungary, ranked sixth among immigrants in point of numbers furnished, but who are now united with the fellow Czecks in the war-born nation of Czecho-Slovakia, and it applies as well to the Bohemians, Croatians, Slovenians, and Finns, all of them important immigrant races who have ceased to be subject peoples.

The Department does not look for any particular change in immigration from France. It has always been small; the total admissions from that country during the 100 years for which statistics are available are only 523,806. Italy, Austria-Hungary, and Russia each contributed a greater number in the two years just preceding the war, 1913 and 1914, than France did during the century.

England has long been an important emigrant furnishing country, and while her overseas dominions have attracted the majority of them in recent times, the United States has always received a generous share. On the contrary, this country has always been the haven of a majority of those leaving Ireland, but this movement is now little more than a shadow of what it was in earlier days.

So far as the neutral countries are concerned, it is expected that there will be a considerable influx of deferred immigration.

Considering Europe as a whole, there are some factors growing out of the war which may retard immigration and many which may promote it. Future immigration will depend primarily on the ability of European countries to initiate an era of peace and profitable employment for those who have survived the war and those who hitherto have been occupied in its pursuit.

Emigration to Europe.—Careful attention is due to the subject of alien emigration from the United States to Europe. Large numbers of former immigrants will return to their native countries either permanently or temporarily, but there will be nothing like a general exodus. The extent of the outward movement will, as in the past, very largely depend on economic conditions here and in Europe. Emigration is no new thing but has been one of the most striking characteristics of the newer movement of European peoples elsewhere discussed. Official records of the outward movement of aliens date only from 1908, and in the seven fairly normal years up to the outbreak of the war a total of 2,217,000 emigrant and nonemigrant aliens departed for Europe, compared with 6,200,000 immigrant and nonimmigrant aliens admitted from that source. In other words, 36 aliens left the country for every 100 admitted. That this condition was not peculiar to the particular period under consideration is shown by records of the Transatlantic Passenger Association, which disclose that during 22 years (1899–1910) as many as 37 steerage passengers were carried from the United States to Europe for every 100 brought from European to United States ports. Thus it is an established fact that emigration is by no means a recent phenomenon but is a fixed concomitant of the movement from Europe.

During the five war years the average annual emigration to all Europe was only 106,000, compared with an annual average of nearly 217,000 in the seven years prior to the war, and the formerly large annual exodus to Austria-Hungary, Russia, and other eastern European countries almost entirely ceased. If normal conditions had continued during the last five years it may be presumed that approximately 1,500,000 aliens would have returned to Europe, instead of the 530,000 who actually did return. It is natural to suppose that many whose home-going has thus been deferred will depart whenever steamship facilities are available. To what extent previously made plans may have been changed by reason of the war can not be estimated. However, owing to conditions in Europe many who had intended to return are likely to remain here permanently and send for their families. That many should desire to go to their native lands to visit relatives, look after property interests, or to bring over their families is only natural, and following the signing of the armistice there was every indication that an exodus of this nature would occur as soon as ocean transportation became available. Reports have reached the Department, however, which indicate that the disturbed conditions prevailing in Europe have led many to postpone if not abandon that purpose.

Chinese immigration and exclusion.—The records show that a single immigrant from China arrived in 1820, the first year of our immigration statistics, and that up to 1853 a total of only 88 had come. The

discovery of gold in California, which attracted people from nearly every country in the world, soon brought the Chinese also, and 1854 witnessed the beginning of what was to be the first Asiatic problem in the west, for 13,100 were then admitted from that country. The influx was practically unrestricted for 30 years, and during that period (1854-1883) more than 288,000, or an average of 9,600 a year arrived, but the immigration was checked as suddenly as it began, by the adoption of an exclusion act. In 1884 only 279 and in 1885 only 22 immigrants were admitted from China. During the 35 years following exclusion, that is, from 1884 to 1919, the total immigration from that country has been, in round numbers, 56,500, or an annual average of about 1,600, showing that exclusion measures have materially reduced the number. As a matter of fact, during the 12 years (1908-1919) that records of emigration as well as immigration have been kept, the number of aliens departing for China has slightly exceeded the number admitted from that source. It is also interesting to note in this connection that as the result of exclusion the number of Chinese in the United States has decreased quite rapidly in recent decades, as the following figures giving the number of natives of China in our population at various census periods will show:

1860.....	35,565
1870.....	63,042
1880.....	104,468
1890.....	106,701
1900.....	81,534
1910.....	56,756

It may as a natural consequence be expected that the census of 1920 will show a further decrease, for, as already stated, emigration has exceeded immigration.

The story of how Chinese exclusion was brought about is an interesting one. The people of California had been opposed to the immigration almost from the beginning. Following the negotiation of the Burlingame treaty of 1868, agitation, though abated for a time, was again renewed. California enacted restrictive legislation, but it was declared unconstitutional by both the State courts and the Supreme Court of the United States. In 1876-77 a Congressional inquiry took place, after which appeals from the Pacific Coast States and their representatives became more vigorous in support of exclusion. In 1879 Congress passed a bill limiting the number of Chinese who could come to the United States in any one vessel to 15. This was the first Federal measure passed on the subject, but President Hayes vetoed it.

In 1880 a treaty was concluded with China which gave the United States the right to "regulate, limit, or suspend" the immigration of Chinese laborers, but not to "absolutely prohibit it." In 1882 Congress sought to take advantage of the provisions of the new treaty

and passed a bill suspending the immigration of Chinese laborers for 20 years; this was vetoed by President Arthur. Later in the same year, however, a bill providing for a 10 years' suspension but giving the right of reentry to Chinese lawfully in the United States, became a law. In 1884 another law was passed which strengthened the law of 1882 in some particulars.

In 1886 China indicated a desire to negotiate a treaty to prohibit the emigration of Chinese laborers to the United States, even including laborers who had been in this country and returned to China. Such a treaty was drawn and signed on March 12, 1888, its provisions being that Chinese laborers should be excluded for 20 years, and that those who returned to China would not be permitted to reenter unless they had left in the United States a wife, child, parent, or property to the value of \$1,000. An effort was made in the act approved September 13, 1888, to carry out its provisions, but China's final refusal to ratify the compact nullified its vital parts. Then followed the act approved October 1, 1888, known as the Scott law, which closed the doors against even returning Chinese, so that practically complete exclusion was provided. In 1892 the famous Geary Act was passed which extended the exclusion act of 1882 for another 10 years, and made various amendments, including a provision providing for registration of all Chinese laborers within a stated period.

Following this legislation negotiations were resumed, and on December, 8, 1894, a treaty was proclaimed which provided for the exclusion of all Chinese laborers for 10 years, except returning laborers who had wives, children, parents, or property worth \$1,000 in this country, thus nullifying the drastic provision of the Scott law, which refused departing Chinese of every class the right to return.

In 1902 a law was enacted which extended all Chinese-exclusion laws then existing "without modification, limitation, or condition," and in 1904 such laws were made applicable to the insular territory. Chinese immigration from such territory to the mainland, or from one island group to another, was prohibited.

The only classes of Chinese aliens now admissible to the United States are teachers, students, travelers for curiosity or pleasure, merchants and their lawful wives and minor children, officials of the Chinese Government and their body and household servants, persons holding return certificates, persons passing in transit to some foreign country, and those whose physical condition necessitates immediate hospital treatment. During the fairly typical year of 1918, when 1,576 Chinese immigrants were admitted, the principal occupations represented were as follows: Professional pursuits, 60; laborers, 127; merchants and dealers, 564; servants, 17; miscellaneous, 477, and of such as gave no occupation, including women and children, 331:

Chinese women have never come to the United States in great numbers, and in 1882, when the flow from China reached its highest point, only 116 females were among the 39,579 immigrants arriving. The proportion of women in recent years has been larger than formerly, but the average annual admissions are now only about 260. According to the census of 1910 the population of continental United States included only 1,788 females who were born in China, and a few of these were not of the Chinese race. Putting it in another way, there were in 1910, 3,074 males to every 100 females in our Chinese-born population. No other people showed such a wide disparity in this regard; the nearest competitors being the Montenegrins with 1,833 and the Bulgarians and Greeks with, respectively, 1,540 and 1,193 males to every 100 females, while among oriental peoples other than Chinese, the Japanese showed 870 and natives of India 427 males per 100 females. This lack of women is obviously a highly important factor in the situation because it insures a slow increase in the purely Chinese population.

JAPANESE IMMIGRATION.

Japan appears in our immigration statistics for the first time in 1861, when one person was admitted from that country, but the movement did not become important until much later, as the following record of admissions by decades since 1860 will show:

1860-1869.....	137
1870-1879.....	193
1880-1889.....	1,583
1890-1899.....	13,998
1900-1909.....	139,712
1910-1919.....	77,125

The census records mention Japan for the first time in 1870, and the number of natives of that country in the United States at that and subsequent census periods were as follows:

1870.....	73
1880.....	401
1890.....	2,292
1900.....	24,788
1910.....	67,744

The above immigration figures include the movement to Hawaii as well as to the mainland since 1900, while the census figures relate only to continental United States. The number of native-born and foreign-born persons of the Japanese race in Hawaii in 1900 and 1910 follows:

Nativity.	1900	1910
Born in Hawaii.....	4,881	19,889
Foreign born.....	56,230	59,786
Total.....	61,111	79,675

It will be remembered that the passport agreement, which was made in 1907, provides, in effect, that Japan will not issue passports good for continental United States to laborers unless such laborers are coming to resume a formerly acquired domicile; to join a parent, husband, or children; or to assume active control of an already possessed interest in a farming enterprise in this country. While the agreement relates only to immigration to continental United States, Japan soon voluntarily extended the same provisions to Hawaii, so that in effect all immigration of Japanese laborers is subject to its terms. Nonlaborers, of course, are not affected and are free to come and go under the same conditions as aliens of other nationalities.

During the 10 years prior to the agreement (1899-1908), a total of 142,656 Japanese immigrants were admitted to the United States and Hawaii, as compared with 80,532 admitted in the 11 years 1909-1919. While there has been a numerical reduction in the influx under the agreement, there is still a very considerable immigration from Japan. It is only possible to conjecture what the extent of such immigration might have been had it not been for the restraining effects of the agreement. Japanese immigration reached the high-water mark in 1907, when 30,824 of that race were admitted.

In 1909, the first full year under the agreement, only 1,596 Japanese were admitted to continental United States, but the number increased regularly year by year, until it reached 7,671 in 1919. Immigration to Hawaii has fluctuated considerably during the period since the agreement, 1,679 being admitted in 1909, 4,062 in 1914, and 2,385 in 1919. The influx as a whole—that is, to Hawaii and the mainland combined—increased from 3,275 in 1909 to 10,056 in 1919, or more than threefold.

It is a noticeable fact that the comparatively large ingress of Japanese since the agreement is due to the increased immigration of women. This is clearly brought out by the statistics, which show that 122,293 males were admitted during the preagreement period, compared with only 33,510 admitted under the agreement, while the total number of females coming in these two periods was 20,363 in 1899-1908 and 80,532 in 1909-1919.

The increased number of women is not considered surprising in view of the fact that the agreement leaves Japan free to grant passports to women coming to join husbands, although such women may be of the laboring class and may become laborers here. A large part of the women thus admitted secure the right to come under the terms of the agreement based on a peculiar wedding ceremony or contract whereby women in Japan become the wives of men already in the United States, the class being popularly known as "picture brides."

Prior to May 5, 1917, if female applicants were otherwise admissible under the general terms of the immigration law then in force, and pre-

sented papers issued under the agreement, admission followed only after the performance of a marriage ceremony in accordance with the laws of this country. This, in effect, allowed a picture bride while in an immigration station at a United States port to qualify as the wife of a resident of the United States in order to become admissible under our immigration law—something not contemplated by either its spirit or letter. In other words, a woman, no matter whence she might come, arriving at one of our ports without possessing the qualifications required by our law for entry might qualify by being permitted to assume a status *after* arrival which she should have had *before* arrival. This practice was not satisfactory to the Department. Therefore when the present immigration act containing the illiteracy test was passed it became imperative before it took effect to fix the legal status of these alleged marriages, as a number of the women who applied for admission as such wives had been found to be illiterate. In the absence of treaty provisions the validity of such a marriage is to be determined by the law of the place where it is celebrated, and if valid there it will, generally, be regarded as valid in any State or country in which the parties may subsequently reside, although invalid under the law of the subsequent domicile if contracted or celebrated there. It therefore became necessary to ascertain what was the law of Japan upon the subject, and whether that nation provided for and made legal a marriage contracted while one party to the marriage was living there and the other at the time actually in a foreign jurisdiction. The Department accordingly made extensive investigations, as a result of which it was learned upon high authority that the Japanese law provides for the complete legalization of the marriage ceremony upon official notification by the contracting parties and their witnesses to the Government registrar; that this notification may be either oral or in writing, and if the latter is the case it is not necessary that the parties appear personally before the registrar, but the notification to him may be made by a duly signed and sealed document, the place of actual residence of the parties not being material; that under this law it is possible for a Japanese man residing in the United States to contract a valid marriage with a woman residing in Japan by giving official notification to the registrar in that country in writing over his personal signature and seal; that the woman who becomes a party to a marriage of this kind is always furnished with a certified copy of the family registry, attesting the marriage, upon which document the Japanese Government issues to her a passport as the *wife* of a Japanese resident of the United States. Accordingly the Department (May 5, 1917) adopted the following rule of administration:

That the validity of these marriages be recognized unless or until it is definitely shown that they are not legal marriages under the laws of Japan, or until it satisfactorily

appears that the residence in the United States of one of the parties brings the consummation of the marriage ceremony within the jurisdiction of our laws; that proof of such marriages be required not only by a certified record of the registrar but also by a certified copy of the notification of marriage made out by the party to the same living in the United States; and that marriages at our ports be prohibited.

In pursuance of this rule passports issued to wives of Japanese as above indicated are accepted, unless fraud or mistake in their issuance or presentation to immigration officers is made to appear, and marriages at our ports have not since been permitted.

The Pacific Coast States continue to be the destination of nearly all Japanese immigrants, and 82.5 per cent of those admitted to the mainland since 1909 expressed the intention to reside there as compared with 88.5 during the preagreement period. California is far in the lead of other States, as shown by the fact that prior to the agreement 44.9 per cent were destined to that State as compared with 62.1 per cent during the past 11 years. On the other hand, the proportion destined to Washington decreased from 37.1 per cent of the whole in 1899-1908 to 16.1 per cent in 1909-1919.

The total number of Japanese aliens, immigrant and nonimmigrant, admitted to Hawaii and the mainland in 1909-1919 was 116,728, and the total number of emigrant and nonemigrant aliens leaving was 97,849, showing an excess of arrivals over departures of 18,879. In this connection it may be noted that 13,579 more males departed than arrived during the period, while among females the excess of arrivals over departures was 32,458.

OTHER ASIATIC IMMIGRATION.

The Pacific Coast States were for a time faced with an inflow of East Indian laborers which, if it had not been checked, would have assuredly created another serious problem. Nine immigrants of this race were admitted in the year 1900, but the number increased until in 1910 it had reached 1,782. This was not a large number as immigration goes, but the Pacific Coast States had had experience with other oriental immigration which began in a small way and developed to large proportions. Demands for exclusion were made, which was in part possible under the then existing law. The number admitted in 1911 was only 517, compared with 1,782 in the previous year, while in the next six years (1912-1917) a total of only 756 came. The attitude of Canada toward East Indian immigration also helped materially to reduce the number coming to the United States.

Various laws were proposed as a barrier against possible future immigration from India, but this was finally accomplished through the so-called barred-zone provision in the immigration act of February 5, 1917. Section 3 of that act provides in part for the exclusion from the

United States of natives of the continent of Asia and adjacent islands lying within certain specified meridians of longitude and parallels of latitude. The barred zone thus described includes India, Siam, Indo-China, parts of Siberia, Afghanistan, and Arabia, the islands of Java, Sumatra, Ceylon, Borneo, New Guinea, Celebes, and various lesser groups. Exception is made in favor of Government officials, travelers for curiosity or pleasure, and persons of certain specified professional classes, so that in effect laborers only are prohibited. The actual boundaries of the barred zone include a portion of China, but the act provides that where immigration regulation—or rather exclusion—is “provided for by existing treaties” the geographical exclusion is not applicable; hence China is not within its scope.

OTHER IMMIGRATION SOURCES.

Canada.—The records of earlier immigration from Canada are very incomplete, but our census shows that as early as 1850 there were 147,711 natives of that country in our population. In 1910 it had reached 1,204,637, including 385,083 French and 819,554 of other origin. Newfoundland had contributed an additional 5,080, but natives of Canada alone ranked fifth among our foreign-born peoples, being exceeded only by natives of Germany, Russia, Ireland, and Italy. This record indicates Canada's importance as a source of immigration.

On the other hand there has been, particularly in recent years, a considerable amount of emigration from the United States to Canada, including both natives of this country and of former immigrants, and the Canadian census shows that there were 303,680 natives of the United States in the Dominion in 1911, as compared with 127,899 in 1901, and 80,915 in 1891.

During the 11 fiscal years 1909–1919, the total immigration from Canada to the United States, including returning American citizens, was approximately 1,288,000, as compared with an emigration to Canada from the United States of 1,072,000, or a balance of about 216,000 in our favor. In the movement of the United States citizens alone to and from Canada the balance is in favor of the latter, for during the past 10 years nearly 562,000 have gone there and about 367,000 have come to the United States. It should be understood that these groups do not include those who cross the border temporarily in either direction, but only those who come or go for permanent residence.

Alien immigrants from Canada to the United States are largely made up of persons of northern and western European descent or birth. The chief elements in the order of their importance are the English, French, Scotch, Irish, German, and Scandinavian. Peoples of southern and eastern European stock form relatively a small part of the movement.

Mexico.—Immigration from Mexico is not very large, but it plays an important part in the labor supply of the southwest. In fact much of it is occasioned by the demand for labor in the border States. The records show that in the past 20 years about 187,000 immigrants have been admitted from Mexico. The majority of these were native Mexicans, but there is also a small movement of Europeans and Asiatics over the border every year. The immigration legislation of Mexico lacks the restrictive features of our system, with the result that some diseased, criminal, or otherwise inadmissible aliens from Europe and Asia seek illegal entry over the Mexican border, making that border an exceedingly difficult field of work.

West Indies and Central and South America.—The West Indies, including Cuba, Jamaica, and other islands, have become an important source of immigration in recent years, the total admissions during the past 20 years being approximately 215,500. The peoples chiefly represented in this movement are African (black), who came mainly from Jamaica and the Bahamas, Cuban, and Spanish. As in the case of Mexican immigration, many of those coming from the West Indies are seasonal laborers who find employment in Florida, but the development of steamship connections between the islands and northern ports has resulted in a considerable movement of Negroes who stay more or less permanently in New York, Massachusetts, and other eastern States.

There is comparatively little immigration from Central and South America, the total number coming from these two sources in the last 20 years being 20,603 and 52,009, respectively. These are divided between natives of the various countries and Europeans who settle there for a time and then move to the United States.

Australasia.—Australia, New Zealand, and Tasmania combined have contributed somewhat less than 22,000 immigrants in 20 years, the majority of these being of British stock. There has been no increase in the movement in recent years and there is little or no indication that these far-away countries will ever become a source of much immigration.

THE PASSPORT VISÉ SYSTEM ABROAD.

As stated in my annual report for 1918, shortly after our entry into the World War it became apparent that the United States must protect itself against the enemy, both at home and abroad; and, on the 26th day of July, 1917, the Secretary of State and the Secretary of Labor issued a joint order requiring passports and certain information from aliens desiring to enter the United States during the war. This joint order, and the regulations issued thereunder by the Department of State, were the result of conferences between the two

Departments upon the subject of proper supervision of aliens coming to this country during the continuance of the war. While these regulations were being enforced at our seaports and on the borders by immigration officers, and abroad by the diplomatic and consular officials, efforts were directed by the interested branches of the Departments of State, Treasury, War, Navy, Justice, and Labor toward the preparation of a law on that subject. These efforts resulted in the passage of the act of May 22, 1918, "To prevent in time of war departure from and entry into the United States contrary to the public safety," upon which the proclamation and Executive order of the President were based, establishing regulations the enforcement of which in foreign countries devolved upon the diplomatic and consular services, and in our own land upon the Customs Service of the Treasury Department and certain officials of the Department of Justice, and upon the Bureau of Immigration. As a part of these regulations the joint order above referred to was continued in force by Executive order.

CHILDREN'S BUREAU.

According to the act of April 9, 1912, creating the Children's Bureau, it is its duty to investigate and report upon all matters pertaining to the welfare of children and child life. The law provides that the bureau "shall especially investigate the questions of infant mortality, the birth rate, orphanage, juvenile courts, desertion, dangerous occupations, accidents and diseases of children, employment, legislation affecting children in the several States and Territories." Much effort has been made to cover this great field, but the task of investigation is scarcely begun. Reports have been made in various forms with a view to making the results of investigations available to the largest possible audience. The intensive investigations have been reported in the usual form of bulletins. Other forms of publicity have been utilized, among them Children's Year.

Various Government bureaus are carrying on technical studies in their own fields involving the welfare of children, directly or indirectly. Such studies should not be duplicated. But it is evidently the intent of the law, according to the words of the statute quoted above, that the Children's Bureau—the only Government body dealing only with children—should be charged with general responsibility for studying and popularizing information in the whole field of child welfare. Hence a recognized coordination should be established between all Government bureaus dealing with scientific studies or popular activities affecting children, and such studies and activities should be undertaken with mutual understanding. It is therefore felt that it would be especially desirable for other departments of the Government which include bureaus,

services, or divisions studying problems including children to designate representatives to act upon a standing liaison committee, and congressional action is suggested to the same end.

It has been possible for the Children's Bureau to accomplish the work of Children's Year because of the special allotment of \$150,000 from the President's fund for that purpose. During the progress of the year and in the follow-up work since last April there has been an increasing demand upon the bureau for investigations of various types, surveys, children's health conferences, and other demonstrations—all work of a constructive character and in the highest degree important. The appropriation available for the current year compels the bureau to leave this work untouched for the greater part. According to a moderate plan of reorganization based upon the experiences of last year a total appropriation of \$473,220 is requested. This is a minimum estimate for efficient work on lines already undertaken; it must be augmented in order to develop new lines of investigation.

Children's Year.—The general purpose and activities of Children's Year as a war-time activity were stated in my sixth annual report. Children's Year ended April 6, 1919, the close of the second year after this country's entrance into the war, and although its results can not be reckoned fully either now or at any time, certain outstanding facts indicate its widespread influence. The interest aroused by the campaign continues and grows. State Children's Year chairmen of 31 States have formed themselves into an advisory committee offering cooperation with the Children's Bureau and forwarding many kinds of child-welfare work in their respective States. During the past year, in cooperation with the women's committees of the Council of National Defense, about 17,000 local child-welfare committees were organized with a membership of several million women who enlisted the professional aid of physicians, nurses, and others and obtained local financial backing for their work. Over 18,000,000 copies of publications were sent out in response to requests during the year.

Child hygiene.—The weighing and measuring test of babies and children of preschool age has been conducted up to May 4, 1919, by these committees in 16,811 cities, towns, villages, and rural communities, and the Children's Bureau has distributed in response to requests over seven and one-half million record cards for use in these tests. In its literature the Children's Bureau has shown the value of child hygiene divisions as a needful feature of a competent State organization for child protection. Since the announcement of Children's Year, 21 States have created such child-welfare divisions, in two cases under the State department of education, in 19 under the State department of health. The total number of States so equipped is 28 at this writing, and the establishment of such

divisions is under discussion in other States. In addition to the emphasis on keeping young children well given by the weighing and measuring test, the bureau in cooperation with the women's committee of the Council of National Defense, the Playground Association of America, and 16 other national societies, and the Department of Agriculture Club and Demonstration Directors carried on in the summer and autumn of 1918 a Recreation drive on behalf of wholesome recreation for older children.

Child labor.—Forty-five States, New York City, the District of Columbia, and Hawaii organized special committees for Back-to-School and Stay-in-School drives which are continuing with increasing momentum. This was done because of the recognition that the true way to eliminate child labor is to substitute school.

Standards of child life.—As the crowning activity of Children's Year it was decided to hold a Conference on Child-Welfare Standards with the purpose of getting, by a consensus of expert opinion, a statement of "irreducible minimum" standards as suggested by President Wilson in his letter approving Children's Year. It was believed that such a statement would give a point of departure, not a goal. It would give a definite working basis and be a consistent and forward-looking contribution to the work. An allotment by the President from his fund made possible this conference, which accordingly took place in May. The first session was held in Washington. A limited number of invitations were sent to representative authorities for a round table conference upon the various aspects of child welfare. Following that, regional conferences were held in Boston, New York, Cleveland, Chicago, Minneapolis, Denver, San Francisco, and Seattle, which were attended by large and representative audiences. The public press gave them excellent reports.

Because of the extraordinary work for the protection of childhood carried on abroad under war conditions, the severity of which this country did not experience, it was decided to invite a small number of foreign authorities to attend the conference. Guests accepted from England, Belgium, France, Italy, Serbia and Japan, and their assistance is most gratefully acknowledged. Members of the party not only attended the conference in Washington and all regional conferences, but also addressed representative bodies such as the Woman's Trade Union League, the Southern Sociological Congress, the National Conference of Social Work, Civic Associations, etc.

At the Washington conference standards of child welfare were worked out and submitted by committees appointed for that purpose. They have been printed and widely distributed for discussion, criticism and comment being invited. In the light of all the suggestions received they have been revised by a special committee appointed by the Washington conference.

Much interest has been shown in these standards and it is hoped that they may prove a strong influence in securing attention for further needed legal protection for children by the Federal and State Governments. Among measures urgently important for strengthening the young of the Nation are two which are really implicit in the standards:

1. Federal aid to States for universal elementary education, for the prompt and immediate abolition of illiteracy and of child labor.
2. Federal aid to States for the universal public protection of maternity and infancy.

In this summary, attention will be asked for the second measure only.

Public protection of maternity and infancy.—The Children's Bureau series of reports on infant and maternal mortality in urban and rural areas has for the last seven years steadily accumulated evidence of a high degree of annual wastage of life and vigor. The studies show that poverty and ignorance are yokefellows and that civic responsibility for decent conditions of living is only beginning to reach an expression which can help to ease the burden.

More than 16,000 mothers die yearly from causes incident to child-bearing, and ill health is suffered by a vast number of others from the same cause. These deaths and disabilities are now known to be needless; among women who can command adequate care their proportions are greatly reduced. Over 200,000 babies less than a year old die annually. These infant deaths are controllable almost without exception. Poverty is a constant condition of the highest infant mortality rates, and the rates steadily improve as income increases to a good living standard. In the interest of humanity and of sound national economy adequate care for maternity and infancy should be universally available. The lessening rates of infant mortality in the United States for the last few years are encouraging. They indicate the effect of many scattered public and volunteer activities for infant welfare, but the reduction is far too slow. New Zealand still shows a much lower rate than our best States, and the United States is eighth from the head of the list of countries judged by the favorable character of their infant mortality rates. The best available world figures for maternal mortality show that the United States is fourteenth down the list; that is, the life of the mother is safer in thirteen other countries than in the United States. The neglect of maternity is shown by the fact that in a thirteen-year period during which deaths from communicable diseases have been reduced—typhoid-fever deaths cut in half, croup and diphtheria reduced two-thirds—the deaths of mothers from causes incident to childbirth show no diminution, although these causes are also known to be in great measure controllable.

Based upon American studies and upon the experience of various other countries, a measure believed to offer a practicable plan for reducing the present losses of life and vigor was proposed in the last annual report of the Children's Bureau. The essential feature of the proposed plan is that the United States Government shall cooperate with the States in providing a joint fund in each State to be used so as to afford effective means for the protection of maternity and infancy. Mothers and babies are the same in the rural community and the city areas. They need the same care. The rates of death are approximately the same. The proposal therefore is of general application.

The principal features of such care are—

- (1) Public-health nurses.
- (2) Accessible hospital care and medical attention.
- (3) Teaching and practical demonstrations for mothers of the hygiene of maternity and infancy and of the household arts essential to the well-being of mother and child.
- (4) Accessible consultation centers, or well children's clinics for the periodical examination of young children in order to secure their most vigorous development.

It will be seen that such a program involves more than medical and nursing care. For example, the State university extension divisions and departments of home economics are already doing excellent pioneer work and can greatly assist the plan. The public libraries, especially those in smaller towns, and the traveling libraries are already undertaking an educational function in the careful distribution of pamphlets and literature for mothers.

Such a partnership between the Government and the States already serves agriculture through the Smith-Lever law and vocational training through the Smith-Hughes law, and is creating through the joint work of the Government and the States a new and cleansing knowledge of social hygiene, and is slowly removing the isolation of the remote ranch and farm family by the good-roads act. On exactly the same plan of Federal aid stimulating and standardizing State and local activities, the well-being of mother and child, a basic national economy, may be secured.

It may be suggested that health insurance schemes with maternity benefits are in operation in European countries,¹ and the question is raised as to whether they offer a satisfactory method of meeting the need. The experience of England seems to show that a general measure of such character as that outlined above is absolutely essential in a country of modern standards of health and comfort even when health insurance exists.

The health-insurance law of the United Kingdom went into operation in 1911. It provides a benefit of \$7.50 upon the birth of a child for the wife of an insured man and double that sum if the wife herself

¹ Maternity Benefit Systems in Certain European Countries, by H. J. Harris. Children's Bureau publication.

is insured and the wife of an insured man. Yet since the insurance law went into effect two measures have been passed by Parliament permitting grants in aid to sanitary districts for the protection of maternity and infancy. They are clearly an expression of a belief that no provision already in existence is adequate.

As applied to the United States, it may be said with certainty that any public provision for safeguarding maternity and infancy must be universal. It must afford a dignified service which can be utilized with the same self-respect with which the mother sends an older child to the public school. It must not be compulsory. In this connection Australian parliamentary reports of 1917 are of interest. For the last seven years¹ the Australian Commonwealth has allowed for each living birth the sum of \$25 and the acceptance of this allowance is general. Yet the report on infant mortality submitted to the Australian Parliament in June, 1917, by the committee concerning causes of death and invalidity in the commonwealth strongly urges the adoption of a general scheme of practical measures, such as are in force in New Zealand and elsewhere, as a means of lessening the infant mortality rate.

When the matter is carefully examined it becomes clear that only a plan of public cooperation making generally accessible instruction in public-health nursing and medical and hospital care offers the safeguards of life and vigor which are needed.

Necessity for food studies.—The mounting cost of living and the effect on infant feeding and the dietary of young children is illustrated by the Children's Bureau studies of the amount of milk consumed by children in three cities—New Orleans, Baltimore, and Washington. Attention is called to the importance of milk in the dietary of the growing child in Bureau Publication No. 35, *Milk the Indispensable Food for Children*. These studies indicate that milk has a value as a food which can not be measured by its cost and show the danger many parents are incurring by taking milk away from young children because they consider the price prohibitive.

National attention has been drawn to the subject of food, and especially to its relation to the nutrition of children, by the increase in the price of the essential foodstuffs such as milk. The fundamental factors in child health other than food are less well understood, but it is most important to secure and to popularize this essential knowledge.

In fact little headway has been made in ascertaining what are the irreducible minimum developmental requirements of a growing child. There have been, as far as we know, no intensive studies or surveys to ascertain what a child ought to have in order to be reared properly, a need that is strikingly brought out in Mr. Ogburn's development of

¹ Since Oct. 10, 1912.

"The financial cost of rearing a child." As Mr. Ogburn adds "this is a most important question—and no doubt others will develop it."

Considering the general marked advance in the price of food, clothing, and other items in the family expenditure and the possibility that the high cost of living may endanger the health of the growing child if economies are made in the food, clothing, and other commodities used by him, it would seem vital to the welfare of our children that intensive and general surveys be made at this time to ascertain what are the irreducible minimum requirements of a growing child and how their attainment is being affected by high prices.

Such studies of actual living conditions require a considerable period of time. They must be made by trained investigators with the aid of nutrition experts and should be interpreted into practical terms for the use of the average mother. They must be related to actual living conditions within the household and to outside conditions such as climate, situation, size of community, available home products, and accessible markets.

The timeliness of such investigations is apparent to any one interested in child welfare.

Children of Territories and islands.—The lesson of the present time is that no class can be protected alone; that only universal provisions are equitable or socially prudent. Illiteracy and child labor flourish together in rural areas in the United States and efforts are being made to eliminate them together. They are found together in the islands which are within the protection of the United States. Porto Rico according to recent reports has special problems of child welfare, as have the Virgin Islands, Hawaii, and the Canal Zone.

For the past seven years the bureau has been occupied with investigations of "matters pertaining to the welfare of children and child life" in continental United States. In the first year of its existence it was asked by the then Secretary of War to make reports upon the children of the islands under the protection of the United States, but the resources of the bureau have never permitted this expansion. Various considerations, however, urge study at this time of the needs of those children who are indeed legally under the protection of the United States yet who are so far removed from American observation that comparatively little is known of them. Especial attention is called to the children of Porto Rico and of the Virgin Islands.

The Virgin Islands: The Virgin Islands were purchased from Denmark in 1917, and an act passed by Congress provided a temporary government for them. Little can be presented as to living conditions in the Virgin Islands, but thanks to the census taken by the United States Census Bureau in 1917 certain facts are available which are recognized as indicative of the degree of well-being enjoyed by a people.

The population of the Virgin Islands in 1917 was 26,051, of whom 7,321 were under 14 years of age. At the date of the last Danish census, in 1911, the population was 27,086. This shows a decrease of 4 per cent in the six intervening years. The excess of deaths over births and the excess of emigration over immigration are submitted by the census as explaining a decline in population which has been general since 1835, when the population was 43,178.

In 1917 it was found that 24.9 per cent of the population 10 years of age and over was illiterate. The proportion of illiteracy in continental United States, the purchasing country, was 7.7 per cent in 1910, a rate known to be alarming; and of Denmark, the selling country, 0.2 per cent according to latest available figures for that country, which give the rate for 1907.

The rate of infant mortality is not given in the printed census report but the text contains this statement: "The present high infant mortality rate probably is accounted for mainly by the fact that most of the parents are poor and dependent on their daily wages for a meager livelihood; by the fact that 58.7 per cent of the married women and women living with their husbands by mutual consent were engaged in gainful occupations in 1917, a large proportion of them as field laborers * * *."

The proportion of the women of the Virgin Islands of different age groups gainfully employed are as follows:

Between the years—	Per cent.
14 and 15.....	35. 3
16 and 20.....	63. 7
21 and 30.....	73. 4
31 and 44.....	69. 0
45 and 64.....	63. 0
65 and over.....	28. 6

The proportion of mothers in each group employed is not stated, but since not less than 63.7 per cent of every age group of women between 16 and 45 are employed, clearly the mothers of young children are largely included among those who work for pay.

It is plain that under the four heads enumerated a depressed level of existence is revealed. While many factors, chiefly economic, are involved in the decline of these islands, it is believed that a careful study of the conditions surrounding the mothers and children would be of material aid in proposing methods of securing more satisfactory living conditions.

Porto Rico: By the ratification of the treaty of 1898 the island of Porto Rico was placed in the hands of the United States Government. According to the census of 1910, the population totaled 1,118,012, representing an increase of 17.3 per cent in 11 years. Of this number, 893,392, or 79.9 per cent, were living in rural areas, while only 224,620, or 20.1 per cent, were recorded as living in cities and towns. This

indicates that the problems which affect rural communities are the problems which affect, to a great extent, the entire island.

At the time of this census the density of the population per square mile for the size of the island was more than 10 times as great as that of the United States proper.

In 1910 the percentage of illiteracy for all classes 10 years of age and over, for both sexes, was 66.5 per cent, or practically two-thirds of the population of that age. This showed an improvement over 1899, when for the same classes it was 79.6 per cent. In that year (1899) the percentage of illiteracy for all children between 10 and 14 years was 82.1 per cent; in 1910 this dropped to 49.2 per cent. Despite this improvement, the rate is alarmingly high when we compare the figures for another island possession, Hawaii, for 1910, where the percentage of illiteracy between 10 and 14 years of age is only 3.2, and for the age group between 15 and 19 years, only 13 per cent, as compared to 59 per cent for Porto Rico.

In comparison with the United States, France, Germany, England, and Sweden, Porto Rico represents a very high birth rate. But this is accompanied by a high infant death rate. In 1916-17, the infant death rate was 199; in 1917-18 it was reduced to 173.4.

The report of the Governor of Porto Rico for 1918 states that the reform school is still overcrowded, owing partly to the large demands made for space for boys under sentence by the juvenile courts. Some improvements and enlargements have been made since 1917. The average number of boys in the school for 1917-18 was 156, but the number has lately reached 200, the maximum capacity of the school, but this is not sufficient for the need. From January 1, 1917, to June 30, 1918, 452 children came before the juvenile courts. Nearly one-third of this number were born out of wedlock; more than half never attended school, and of those who did, very few had passed the fourth grade; 77 were homeless.

The most serious drawback to the effectiveness of the juvenile-court law has been the lack of adequate facilities to take proper care of delinquent children. The minimum needs according to the governor's report are a temporary detention home for each juvenile court, a separate home for delinquent children, and an institution to care for the abandoned children. This statement is corroborated by the following:¹

According to the last report of the insular chief of police, it is estimated that there are in the island of Porto Rico at the present time about 10,000 homeless children under 12 years of age who live by whatever means they are able, many of them begging or stealing, and most of them having no permanent lodging place, sleeping at night on boxes or on door steps, or wherever they happen to find a lodging place secure from the rain. These children are for the most part deserted and abandoned children of illegitimate

¹ Fleagle, Fred K.: Social problems in Porto Rico, p. 32.

parentage, or orphan children whose parents have left no provision for their care and education, and they constitute a fertile soil for the implanting of criminal tendencies and are ready material for older people of criminal habits.

BUREAU OF NATURALIZATION.

The work of the Bureau of Naturalization during the past year shows more conclusively than ever before the lack of relationship between citizenship and immigration. During the past year immigration was at its lowest ebb, while the converse was true of applications for naturalization. In the last fiscal year there were 235,894 petitions for naturalization and 346,827 declarations, making a total of 581,730 aliens who took the initial or final steps toward securing citizenship in this country.

The number of admissions to citizenship during the past year was larger than in any preceding year, amounting to 217,358. Leaving out of consideration the year 1918, this was a far greater number than were admitted in any two years during Federal supervision. Military statistics show 128,335 aliens who acquired citizenship after they had assumed the military uniform of the United States. Of 107,559 civilian petitions filed during 1919, 33,251 were filed during the last quarter and could not come to maturity because of the requirement that petitions be posted not less than 90 days before hearing. This left a total of 74,308 petitions filed during the year that could mature. During the last quarter of the fiscal year ended June 30, 1918, there were 34,233 petitions which failed to mature until after July 1, 1918, making a total of 108,541 petitions eligible for hearing during the fiscal year. Of these 89,023 were admitted, leaving a total of 19,518 who failed to receive a final favorable hearing. There were 13,119 petitions denied during the year, leaving 6,399 that were continued. In addition, 38,288 petitions filed prior to the beginning of the year became due for hearing but for various reasons were continued, making a total of 44,687 continuances of petitions for naturalization during the year. In a few cases legal technical requirements were the causes for the unfavorable action. The majority of those not favorably acted upon were continued merely to give the candidates an opportunity to avail themselves of educational facilities now offered in 2,240 communities of the country through the public schools. The number of continued cases is proportionately increased as the public-school facilities become more firmly established in the various foreign communities where applicants for American citizenship reside.

The number of declarations of intention filed is 346,827—less than in the fiscal year 1917 but considerably more than in 1918. However, reports by field officers indicate that throughout the country there are many foreigners unable to file their declarations of intention

because of lack of facilities in the offices of the Naturalization Service and of the clerks of the courts exercising naturalization jurisdiction.

Forty-five certificates of naturalization were canceled and 6 persons convicted for violations of the naturalization law. Five of these cancellation suits were instituted under the provisions of the act of May 9, 1918, and 40, which were instituted prior to July 1, 1918, under the provisions of section 15 of the act of June 29, 1906.

Under the increased authority of the bureau contained in the act of May 9, 1918, the naturalization work was extended to the war camps prior to June 30, 1918, and intensively carried on in them until after the armistice. From that time demobilization gradually lessened this work in the general camps and produced an ultimate discontinuance of naturalization of soldiers, with the exception of those camps in which the returning soldiers were assembled.

FINANCES.

The Bureau of Naturalization is one of the few self-sustaining branches of the Government. Its revenues from naturalization fees during the year were \$599,087.97; the cost of administration was \$812,056.38; showing that the expense of administration during the past year was \$214,968.41 in excess of the revenues from naturalization fees. This is the first time in the history of the bureau that its expenditures have been in excess of its revenues. The total expenditure for administration since its creation was \$4,109,321.64, while the total revenue from naturalization fees was \$4,648,768.44, showing a net total of \$539,446.80 excess revenues for the entire period of Federal supervision.

SPECIAL AMERICANIZATION WORK.

The fifth year of the Americanization work of the Government, carried on under general and specific acts of Congress, was crowned with greater success than any previous one. There was a steady increase in the number of communities pledging cooperation with the Federal Government through the Bureau of Naturalization in providing facilities for the educational training of those who seek citizenship through the naturalization law. Four hundred and thirty-eight new communities, making a total of 2,240, have pledged themselves through the public schools to reorganize their school systems in order that these incoming members of the body politic may be equipped for the responsibilities which they desire and which the welfare of the Nation clearly requires them to assume.

The striking feature of this work is the development of the new element of attendance at these classes. Heretofore, with few exceptions, they have been carrying an enrollment of foreign-born residents only. The percentage of the student body seeking citizenship has ranged from 20 per cent in the first years to more recent instances of

100 per cent attendance of candidates. Under the influence of the communities in which they live and attend the public schools non-candidates have applied for and secured their first or final naturalization papers. The particularly striking new element in the personnel of these classes is the presence of illiterate adult Americans. Reports of 166 superintendents of schools show the organization of 840 classes, 68 of which were holding day sessions and 772 evening sessions. In an enrollment of 15,874 there were 77 classified nationalities reported. The four leading nationalities were Italians, Poles, Portuguese, and Americans. The Italians represented 9.4, Poles 8, Portuguese 4.3, and Americans 4 per cent. The causes leading to the attendance of Americans in these classes primarily organized for the training of the foreign-born are many and need not be enumerated here. The principal cause is doubtless to be found in the fact that for the first time in the history of the country there has been an organization of classes where the illiterate adult American can pursue his education in association with other adults. Heretofore the school systems of the country have been organized solely for the junior element of society. Under the law which has authorized the Government to promote the training and education of candidates for citizenship, organization of public-school systems all over the country has been effected in virtually every community where foreigners live and are candidates for citizenship, and this has offered means heretofore unprovided for illiterate American men and women to overcome the handicaps of life which circumstances in their childhood forced upon them. In this manner machinery has been established by which the problem of illiteracy may be at least partly solved.

Another conclusion that is forced upon the public mind is that men and women aged 30, 50, or 60 years or more may be enabled to acquire a reading, speaking, and writing knowledge of the English language. In the reports referred to from the 166 public-school systems there were 131 men and women over the age of 60 years in attendance, 352 between the ages of 51 and 60, 3,698 between the ages of 31 and 50, 6,059 between the ages of 18 and 31, and 5,634 not classified by age.

It is under specific authority that the Bureau of Naturalization has definitely assumed a new relationship with the foreigner. This authority is found in the language of the act authorizing the promotion of the education and training of the candidates for citizenship by the public schools. Increased public interest has manifested itself through employers of foreign laborers in all parts of the country. Employers who previously had no other relationship than that of employer to employee have felt the necessity for sentiments of interest in and loyalty to this country and have appealed to the Bureau of Naturalization to provide the means by which foreign-born employees

desirous of seeking American citizenship may do so at their places of employment. Representatives of industry, either individuals or committees representing the employers and employees, have been organized and trained in the work of preparing naturalization papers, ordinarily performed only by the clerks of the naturalization courts. As a result of the facilities brought close to hand many thousands of foreigners who under the previous lack of organization had remained inactive have expressed a desire to declare their intention. The creation of these facilities, with the resultant applications for citizenship submitted to the naturalization examiners for examination and the clerks of courts for filing and execution, precipitated a condition not previously reckoned with. The offices of the clerks of courts and the examiners were overwhelmed, and the congestion of applications compelled a virtual cessation of the filing of naturalization papers, solely because the means had become inadequate. A condition of affairs in naturalization matters never before experienced in the history of the country had been created. Aliens desirous of filing their naturalization papers at a time when their action was expressive of the highest sentiment of loyalty discovered that the machinery of the Government, both State and Federal, was powerless to assist them.

Communities have paid for the cost of printing the preliminary naturalization forms; individuals and organizations of a patriotic, philanthropic, religious, commercial, or educational nature have lent their aid to the relief of this appalling situation; yet all to no purpose. Governmental aid of an expert character was insufficient to meet the national need. Communities determined upon an all-American organization have had their plans deferred, if not frustrated, by lack of governmental power by which they might be guided, notwithstanding that the examining force exerted itself to the maximum and the public gave to the utmost its voluntary assistance. So great was the increase in this work that it became necessary in the judgment of the Department to establish a specific division in the Bureau of Naturalization to exercise immediate supervision over it. The Division of Citizenship Training was therefore created and a chief, entitled the "Director of Citizenship," was placed at its head.

During the past year 117,000 copies of the citizenship textbook compiled from material used by the public schools and descriptive of the functions of the Federal Government, were distributed for the use of candidates for citizenship attending the public schools. This book, admittedly inadequate both as to mechanical construction and subject matter, has, nevertheless, been acclaimed throughout the United States by the public-school authorities. It has been submitted to a committee of educators representing the public schools and universities engaged in the solution of the problem of teaching the foreigner. New material has been placed in the hands of this committee, which is

working under the supervision of the Director of Citizenship to the end that there may be issued with the coming school year a book that will be an acceptable standard course in citizenship training.

Notwithstanding the influenza, which adversely affected the public schools as well as all other activities during the past year, there were 3,000 petitioners for naturalization in attendance upon the public schools who received certificates of graduation issued jointly by the local school authorities and this Department through the Bureau of Naturalization. These few thousands represent only a small number of those actually entitled to such recognition. Certificates of proficiency have been authorized and will be issued during the coming school year to those aliens who have only declared their intention and to whom recognition for their hard-earned merit is justly due. A certificate of recognition of the public-school system has also been authorized for issuance to the public schools of each of the communities as an indorsement by the Government of their work in training the foreigner for citizenship responsibilities.

In carrying on this work the Division of Citizenship Training cooperates with the directors of Americanization of the various cities, Americanization committees of chambers of commerce, labor organizations, and industrial concerns, with educational, religious, patriotic, philanthropic, and other organizations having for their objective the welfare of the Nation as it bears upon the individual foreigner. Without their aid this work, which has reached such a high state of development, would have been seriously handicapped. By their aid the conviction that each community should be an all-American community is gradually but surely making strides toward realization.

NATURALIZATION OF SOLDIERS AND SAILORS.

During the past year the important work of vesting with American citizenship that great patriotic body, the loyal foreign-born soldiers making up a large part of the American forces, both military and naval, went steadily forward under varying conditions of difficulty. American citizenship was granted to 128,335 soldiers in the Army camps and adjacent courts throughout the United States. These soldiers were relieved from all the general requirements of the naturalization law, and, because of their adoption of the uniform, accorded full American citizenship. They were also relieved from paying the \$5 fee where they had made no declaration of intention and of the \$4 fee where the declaration of intention had previously been made. This represented an actual saving of \$513,340 in the latter case. The number of those in the former class is unknown and therefore can not be stated. The first report of the provost marshal general, dated December 20, 1917, showed 76,545 foreigners in the Army who had not declared their intention to become citizens of the United States.

The number afterwards inducted into the service without the declaration of intention is not known. To these 76,545 the requirement for a previous declaration of intention was waived, thereby saving the sum of \$76,545, a total, as nearly as can be ascertained, of \$589,885 saved to soldier applicants. This was nearly as large an amount as the total naturalization fees (\$597,087.97) collected throughout the United States from all other aliens. None of the attendant delays in naturalization proceedings were required of them, as the law permitted the immediate hearing of their petitions for naturalization upon being filed. As stated in the last annual report, the law intended to extend to every alien wearing the American uniform the opportunity of American citizenship.

UNITED STATES EMPLOYMENT SERVICE.

WAR ACTIVITIES.

Organization.—On January 3, 1918, the date on which the United States Employment Service was established as a separate branch of the Department, there were in existence but 96 branch offices, operating in 36 States and the District of Columbia. In five other States, seven offices were in operation to which Federal officers were assigned under the cooperative supervision of the Department and the respective State commissioners of labor. In the remaining eight States the Federal Government had no employment agencies. The administrative force in Washington numbered only 12 officers and employees, and the field force approximately 200. By July 1, 1918, there were, in round numbers, 350 offices, with a paid personnel of about 1,700, while the administrative force in Washington had grown to 300. In many of the States the offices are maintained in cooperation with State or municipal agencies.

In addition to the regular personnel of the field force, the organization contained three groups of special volunteers, viz: State Advisory Boards, Community Labor Boards, and the Industrial Advisers. For a short time while these boards were in process of formation there was also in operation in each State a fourth board known as the State Organization Committee. Of these groups of volunteer workers, the State Advisory Boards and the Community Labor Boards are still functioning.

The State Advisory Board in each State is composed of the Federal director of employment as chairman, two representatives of labor, two of management, and two women, one of the latter to represent the workers and the other to represent management. The principal functions of these boards during the war were: (a) To advise the Federal director of employment in matters of policy and to assist him in choosing the members of his own staff and the officers to be placed in charge of the main local offices, including the superintendents of

women's divisions; (b) to recommend removals of said officers, where deemed advisable for the best interest of the service; and (c) revision and approval of the apportionment among the communities of their respective States of the quota assigned thereto for recruiting purposes.

The Community Labor Boards are composed of five members, representative of the United States Employment Service, local employers, and local employees. The number of Community Labor Boards organized and in operation throughout the United States at the end of the war was 1 644. The functions of the Community Labor Boards during the war were as follows:

(a) Decision of all questions concerning recruiting and distributing labor in the community, subject to appeal by any member to the State Advisory Board; all decisions of both State Advisory Boards and Community Labor Boards being subject to regulations issued and approved by the Director General, acting on the advice of the War Labor Policies Board.

(b) Dividing up the total of the community's quota, assigning to industries and employers in nonwar work the proportionate share which each should contribute.

(c) In distributing available labor supplies among local war industries it was the duty of the Community Labor Boards to consult the local employers' committee, which was represented on the Community Labor Board.

(d) The Community Labor Board had no executive duties, but so far as possible assisted in recruiting labor by securing harmonious and cooperative action on the part of employers and employees.

The particular duty of the industrial advisers selected by the Department of Labor was to furnish the district draft boards information as to the needs for skilled labor and the supply in each community, to assist the district boards in arriving at their decisions as to whether or not individuals were performing work necessary to the effective operation of the military forces.

From this synopsis of the form of organization of the Employment Service there will be noted the magnitude and importance of the task of creating it; but when it is considered that, coincident with this work of organization, actual and efficient employment activities have been carried on it will be seen that the demands upon the service have been exceedingly great.

Centralized recruiting and distributing of unskilled labor.—One of the most important tasks allotted to the Employment Service was the vesting in it of exclusive authority for the recruiting and distributing of unskilled labor in war work. This authority was recommended by the War Labor Policies Board and submitted to the President on June 15, 1918, by the Secretary of Labor. The President, on June

17, 1918, issued a proclamation urging all employees engaged in war work to refrain, after August 1, 1918, from recruiting unskilled labor in any manner except through this central agency (the United States Employment Service), and urging labor to respond as loyally as theretofore to any calls issued by that agency for voluntary enlistment in essential industry.

The benefits of this program for centralized labor recruiting were seen in the reducing of labor turnover, in the transference of unskilled labor from nonwar work to war work, and in the direction of unemployed and partially employed wage earners to industries closely allied with the prosecution of the war.

The results were not accomplished, however, without imposing a heavy burden on the service. A system was set up for advancing transportation for the men from a revolving fund. This necessitated the sending of guards or pilots with the shipments. Pressure was brought to bear, in some cases, on plants to have competent employment managers installed so that all questions concerning the conditions under which the men worked and lived might receive proper attention.

As labor conditions became critical, arrangements were made with various agencies, such as the War Industries Board and the United States Highways Council, for restricting nonwar work because of the labor shortage. Under the regulations established by the Department, advertising for unskilled labor was restricted and controlled. Toward the end of the period little advertising was being done, except as authorized by the Department. Private employers, almost without exception, supported the entire program.

There were so many war projects calling for unskilled labor that a list of them would resemble a directory of all the camps, cantonments, munition plants, shipyards, and other war industries in the United States. More than 40,000 employers, engaged wholly or partly in war work, reported regularly to the service concerning their labor requirements. The urgent need of these large plants and others like them for thousands of unskilled laborers, most of whom had to be recruited from distant States, owing to the depletion of the labor supply in the vicinity, gave ample proof of the necessity for a National centralized employment agency. Laborers for some of the eastern plants were brought from as far west as Utah and Arizona.

Skilled labor.—While the regulations covering the central recruiting program placed no restrictions upon employers engaged in war work in recruiting their own skilled laborers, other than that they should avoid interfering with men who were already engaged in other war work, still employers as a rule followed the same plan in securing skilled labor that had been promulgated by the service for recruiting unskilled labor.

In September, 1918, there was established a Facilities Division of the War Industries Board. The membership of this division was composed of representatives of the War Industries Board, the Army, the Navy, the Emergency Fleet Corporation, the Railroad Administration, the Housing Corporation, and the Department of Labor. The chief of the Clearance Division of this service represented the Department of Labor in the work of the Facilities Division. Under the program adopted no construction project in the United States, whether for war or nonwar purposes, could be authorized without the approval of the Facilities Division. That division also secured the adoption of a general resolution to the effect that no new projects could be approved unless it was shown affirmatively that laborers were available for carrying on the work.

Farm work.—The importance of maximum food production during the war led the Department to devote special attention to farm-labor conditions. It secured the active cooperation of the Post Office Department, the Department of Agriculture, and the National organizations of farm and dairy interests. It likewise secured the cooperation of newspapers, motion-picture concerns, commercial organizations, rural telephone lines, the canning industry, and many unofficial organizations, both national and local, with a view to giving the best possible attention to the farm-labor needs of the country. Arrangements were also made for the importation of labor from Mexico and the Bahama Islands.

Saving the wheat crop of 1918, in the great belt extending from Oklahoma through Kansas, Nebraska, and South and North Dakota, was of the utmost importance, and the Employment Service took early steps to meet conditions by conducting a survey to ascertain the approximate number of harvest hands that would be needed from outside sources. In view of the serious shortage of labor that existed in practically all parts of the country efforts were limited to obtain the needed laborers locally or from adjoining States. That the efforts of the Department were successful is shown by reports received from Oklahoma and Kansas to the effect that not a bushel of wheat was lost through lack of labor.

Harvest hands were sent sometimes to the farmer himself, but as a rule were directed to the county agricultural agent or other community representative for distribution. Much valuable assistance was given by local organizations in enrolling emergency volunteer workers. Such workers rendered exceedingly valuable service, particularly throughout eastern Kansas. In Kansas City alone, through the efforts of the chamber of commerce, more than 10,000 men registered as volunteers for emergency harvest work.

Women's work.—When the Women's Division was established in January, 1918, there were in operation but nine branch offices

devoted exclusively to women workers. During the first six months of 1918, 57 separate women's divisions were added by creation of new offices or absorption of State, municipal, or other public employment offices. At a time when "war work" and "entrance of women into industry" had already become popular catch words, much of the work of the United States Employment Service offices for women actually consisted of finding jobs for those dependent on their earnings who were thrown out of work by lessened production. Reduced consumption of many articles, particularly those known as luxuries, first to be dispensed with by the buying public, forced many out of accustomed work. Large numbers of women were affected. They ranged from embroiderers and expert power-machine operators on fine garments to artists, writers, and musicians.

With the creation of the War Labor Policies Board and the Woman in Industry Service of the Department in May and June, the program of the Employment Service in handling women was simplified. "Centralized policy and decentralized operation" led to the abandonment of the Federal Women's Division in order that female labor, like railroad, farm, or technical workers, might be handled as local or State conditions made most feasible. There was provided, however, a woman assistant to the Director General, to have supervision over all matters concerning the employment of women. Sections for women farm laborers, for professional women, for juvenile workers, for reference information, for publicity, for interstate clearance, and others were created to function through the proper division of the Administrative Offices.

Expansion of the number of women's divisions kept pace with the rapid development of the service. Many noncommercial offices with trained personnel linked themselves with the Federal organization. Most offices handled all types of women; others were devoted to a single type, such as domestic, industrial, or professional. Offices for placing both men and women of technical and professional types were developed in some cities. Efficiency and method varied widely. Many offices developed a real technique.

By October 1 control of the employment of women for war needs could have been taken over by the Employment Service at any time such need dictated. Besides the numberless general offices handling both men and women in small cities, on November 11 women's divisions were operating in 40 States, with a variation in number from one each in Arizona and Vermont to 20 in Illinois and 46 in New York. Women were working on over 500 Community Labor Boards. Nearly 368,000 women were reported placed by the United States Employment Service during the 10 war months of the year. This number is equal to about 13 per cent of all placements made during that period.

Public Service Reserve.—The Public Service Reserve was the recruiting arm of the United States Employment Service. It supplemented the employment offices with 15,000 enrollment agents who reached down into the smallest villages and hamlets to tap potential supplies of wage earners. The reserve has furnished the Army, Navy, and executive departments of the Government with thousands of men, mostly of the higher skilled types, such as engineers, technical experts, and skilled mechanics. The Emergency Fleet Corporation has secured from its registration many thousands of skilled men for shipbuilding. Hundreds of officers of particular technical qualifications have been furnished the Army without necessitating a long search on the part of the War Department for the type desired. Many of the civilian administrative heads of the war emergency activities were secured from the lists of the reserve. A few of the special services performed were as follows:

Over 1,500 aviation motor mechanics were enlisted through the reserve in the short space of five weeks, in January and February, 1918, for Gen. Pershing. The names of over 4,500 railway men were submitted to the Division of Military Railways for induction and enlistment into various locomotive and engineering regiments; 470 to the Tank Corps; and 472 in a special drive for tower men for the Navy. The reserve also cooperated most helpfully in the special drive made throughout the country by the Ordnance Department for all kinds of civilian help. It registered and classified a total of more than 300,000 men of various trades. Without doubt production has been appreciably increased and efficiency improved by the ability of the reserve to furnish on short notice men of almost any qualifications.

Boys' Working Reserve.—During the year the Boys' Working Reserve continued to enroll boys of high-school age, principally in its agricultural division. Some of the notable mobilization records are as follows:

In Illinois 21,000 boys worked on farms; in Connecticut, 10,000 boys helped to care for the largest acreage of food crops in the history of the State; in New York State 12,000 and in Indiana 15,000 boys were sent to the farms.

In many instances where special crops were jeopardized by the lack of adequate labor to harvest them they were saved through the prompt assistance of the boys recruited by the reserve. Such was the case in Michigan with regard to the sugar-beet crop, where a large part of the planting would have had to be plowed under had it not been for the timely assistance of the reserve boys. In Georgia reserve boys saved by their sole efforts a valuable apple crop; across the continent in Oregon they helped to save the berry crop. In California a similar invaluable assistance was rendered by the organization in harvesting the immense acreage of fruit crops, including cherries, apricots, plums, and grapes.

SPECIAL SERVICES.

Stevedores and marine workers.—One of the special branches of the United States Employment Service in making more efficient the conduct of the war was the Division of Stevedores and Marine Workers. In normal times men of these occupations worked on certain docks and in certain localities, and it was a common sight to see groups of hundreds of unemployed longshoremen waiting for employment at their favorite dock or locality when at the same time there was a real need for men at other points. While these conditions were well known it required the exigencies of war to develop the machinery for remedying the situation.

Conferences were held in New York by the representatives of the Department, of the longshoremen, the Army, the Navy, Shipping Board, Railroad Administration, and ship owners. It was agreed that there should be formed an elastic labor pool, and that the United States Employment Service should organize and direct the activities of the new division. The longshoremen readily agreed with the proposed arrangement—that the emergent requirements of war made it necessary to change the old order of things, and that henceforth men would shift not only from one dock to another near by, but would go from one side of Manhattan to the other, from Hoboken to South Brooklyn, should it be found necessary, and, as one of the representatives of the longshoremen said, from one port to another, making the Atlantic coast one dock.

There were established in New York seven branches of the Stevedores and Marine Workers' Division. Other branches were established at Philadelphia, Baltimore, Norfolk, Newport News, Charleston, S. C., Mobile, New Orleans, Galveston, Boston, Portland, Buffalo, Seattle, and Duluth. That the service was a success, can be measured by the statement frequently made that the port of New York increased its efficiency at least 30 per cent.

Shipyard labor for the Puget Sound district.—In January, 1918, there was established at Seattle, in cooperation with the Emergency Fleet Corporation, a central office for the recruitment and distribution of labor for the shipyards in the Puget Sound district. Under this plan, the central office took charge of the securing and distributing of all persons required for war emergency work in that district. The executive control of the operation of the office and the carrying into effect of the plan were in charge of the representative of the Department.

Mining Division.—The Mining Division of the United States Employment Service was created to take charge of the recruitment and distribution of the mine labor. Experienced mining men, thoroughly conversant with all phases of the mining industry, representing both mine workers and mine operators, were selected as the

executive officers of the division. After conferences with representatives of the Fuel Administration, the United Mine Workers of America, coal operators' associations, and producers of metals, the Mining Division found that there was a shortage of labor in practically every important coal and metal producing region in the United States. This shortage was due to two main causes: (1) The abnormal demand for coal and metals; (2) the great number of mine workers who had entered the military or naval service. It was evident that the only source of supply of available mine labor was in nonwar industries to which miners had drifted after leaving the mining field. The problem confronting the Mining Division was to locate mine workers employed in those industries. As a prospective solution of this problem, it was deemed advisable to solicit the aid of the local officers of the United Mine Workers of America. With that object in view circular letters were sent to the secretaries of the miners' local unions, with the result that the names and addresses of more than 15,000 practical miners, engaged in nonwar work, were immediately supplied.

The majority of these men were induced to return to the mines. It may be said to their credit that many of them gave up more agreeable and more remunerative positions than could be obtained in the mines. It is a matter of gratification to be able to report that at the time the armistice was signed very few requests for additional mine labor were being received from companies producing coal or metals in any section of the country.

War placements.—The registrations, applications, references, and placements for the '11 war months in which the United States Employment Service operated, that is, from January, 1918, to November, 1918, inclusive, so far as it has been possible to gather statistics, are shown in the following table:

Month.	Registra- tions.	Help wanted.	Referred.	Reported placed.
1918.				
January.....	82,353	80,002	62,642	51,183
February.....	92,452	92,594	70,369	58,844
March.....	144,156	177,831	118,079	100,446
April.....	195,578	320,328	171,306	149,415
May.....	206,181	328,587	179,821	156,284
June.....	246,664	394,395	221,946	192,798
July.....	282,294	481,033	250,152	217,291
August.....	555,505	1,227,705	500,510	395,530
September.....	531,226	1,476,282	513,662	362,696
October.....	594,737	1,588,975	606,672	455,931
November.....	744,712	1,724,943	748,934	558,469
Total.....	3,675,858	7,895,675	3,444,093	2,698,887

It was impossible to secure statistical data with respect to large groups of persons referred to employment through this service but who did not actually pass through the placement offices. As examples

of these classes, there may be mentioned the thousands of men who engaged in work in the harvest fields, of whom no record could be obtained; the experienced miners who were induced to reenter the mines; the stevedores and marine workers who were transferred in many instances from one place of employment to another without any statistical record being kept of their several employments. The heaviest month of placements occurred in November, 1918, when war labor recruiting and the war industries had attained their greatest momentum. The placements for the month of November alone were over half a million, and, as the foregoing table shows, they had been steadily increasing since the previous January.

POSTWAR ACTIVITIES.

After the termination of hostilities the war branches of the Employment Service were discontinued. The regulations governing the centralized recruiting program were canceled, and the control theretofore exercised over the recruitment and distribution of unskilled labor was withdrawn.

Upon the signing of the armistice many of the large war projects either materially reduced their operations or discontinued them altogether. In this way thousands of wage earners were suddenly thrown out of employment, and to this number were added the discharged soldiers. Fortunately, however, the Employment Service rapidly readjusted itself to peace conditions. Up to the time of signing the armistice its problem had been to secure men for jobs; the situation quickly reversed and it had to find jobs for men. This marked reversal came in the early winter months, when nearly all out-of-door work was suspended and when the farmers were not only not applying for men but had just released all the extra help which had been in their employ during the summer and fall.

In consideration of the labor situation, an agreement was entered into by the Secretary of Labor and the Secretary of War which provided that no war contracts should be canceled without the advice of the War Industries Board. That board looked to the Department of Labor for information as to the manner in which the cancellation of contracts would react on the labor situation, and a representative of the Department acted with the War Industries Board for the purpose of supplying to the military authorities information upon employment conditions.

The War Department and the War Industries Board called upon the Department of Labor for this information in order that contracts for war materials might be curtailed or canceled and the Army demobilized with the least possible danger of serious unemployment during the period of reconstruction. To that end instructions were issued on November 20, 1918, to all Federal directors of the Employ-

ment Service, under the terms of which a survey in 122 cities was undertaken and a statement of labor conditions in those industrial centers telegraphed each week to the War Industries Board. This information was of value in the determination of the effect of cancellation of contracts upon the labor market.

While the number of war workers to be released from industries was large, it was felt that the number of men to be discharged from the Army would have a more serious effect on employment conditions throughout the country, particularly when the plan of demobilization by units was announced by the Army. The importance of this subject caused the Employment Service to invite representatives of the national welfare organizations and Government bodies concerned with demobilization to meet in Washington on December 2, to discuss the method of linking all efforts and machinery for assisting soldiers, sailors, and war workers in finding proper employment. A committee was appointed to draft a plan of cooperative action, which was later adopted. Under this plan, there was formed a central board at Washington, with a representative of the Department as chairman, consisting of numerous governmental and welfare organizations.

Steps were then taken to extend the Employment Service, in cooperation with the above mentioned cooperating agencies, by the establishment throughout the country of Bureaus for Returning Soldiers and Sailors. Over 2,000 of such bureaus were established and, in addition, the Employment Service stationed qualified representatives at the demobilization camps and arranged for supplying to soldiers at embarkation camps in France and on board transports all available information concerning opportunities for employment on their return to this country. Thousands of soldiers and sailors daily sought help through the service in finding employment.

After the armistice several special lines of work were undertaken. Among these were the Junior Section, the Handicap Section, and the Professional and Special Section. The Junior Section was established for the purpose of giving vocational guidance to boys and girls between the ages of 16 and 21. The Handicap Section dealt with the placement of persons handicapped by age or some physical disability. The purpose of the Professional and Special Section was to bring together the highly trained man or woman, such as the engineer, the executive, or the teacher, and the position for which he or she is qualified.

CONFERENCE ON EMPLOYMENT.

On April 14 there was addressed a communication to the governors of all the States inviting them to send representatives to a conference on employment, to meet in Washington on April 23, 24, and 25, 1919.

The purpose of the conference can best be described by quoting the call for the conference:

The purpose of the conference will be to define and establish the most effective form of relationship between National and State employment activities and in general agreement bring out a definite objective toward which all may work to the end that a thorough and comprehensive public Employment Service may be permanently established.

Delegates were designated by governors of 28 States. There were also in attendance at the conference a sufficient number of Federal directors of the United States Employment Service to insure satisfactory geographical representation, representatives of the United States Chamber of Commerce, and the American Federation of Labor.

After three days' consideration and discussion of the subject matters before the conference an outline of a bill to provide for a National Employment System was unanimously adopted.

The conference also selected a subcommittee to draft a bill embodying the provisions and principles contained in the outline. Subsequently the subcommittee met and drafted a bill which the Department approved. This bill, H. R. 4305, was introduced in the House of Representatives on May 31, 1919, by Mr. Nolan, of California.

On June 6, 1919, Senator Kenyon, chairman of the Senate Committee on Education and Labor, introduced in the Senate a similar bill, known as S. 1442.

ADMINISTRATIVE OFFICES.

The form of organization of the Administrative Offices adopted on August 5, 1918, a description of which appeared in last year's report, was continued throughout the fiscal year with only such modifications as were made necessary by the change from a war to a peace basis, and the curtailments due to greatly reduced appropriations.

Division of Operations.—At the beginning of the fiscal year, i. e., July 1, 1918, all matters relating to skilled labor were handled by the Skilled Labor Division and matters relating to common labor were handled by the Common Labor Division. These two divisions were later designated as sections of the Clearance Division. After the termination of the war the division was readjusted to meet peacetime functions, and its name was changed to the Division of Operations.

After the signing of the armistice there came an immediate cessation of the urgent demands for labor, and many persons were thrown out of employment. Large numbers of these were semiskilled persons who during the war had been receiving high pay and were indisposed to return to occupations in which they had been engaged before the war. Many of these demanded employment as skilled mechanics, although

their skill was of the most limited type. The Employment Service communicated with the firms whose contracts were being canceled, inquiring as to the number of men that would be released. In many cases persons released from war contracts were immediately employed by the same firm on peace-time work. In other cases it was found possible to transfer them to other plants. In this way the unemployment situation during the winter and early spring, while serious, was greatly decreased. Weekly reports on labor conditions were issued, based on inquiries made in all the principal cities of the country, showing the number of men in each of a group of selected plants from each industry who were employed during the current week and the prospective increase or decrease in employment. The Civil Service Commission kept the Employment Service informed regarding the previous employers of persons appointed to civil-service positions. In this way vacancies were immediately filled to the advantage of these employers, and this procedure contributed its share toward relieving the unemployment situation.

The outstanding features of the employment situation at the end of the year, i. e., June 30, 1919, were a shortage of agricultural and common labor in the West and South, an increasing demand for mechanics in the building trades, stable conditions in most of the mechanical industries, and a considerable surplus of office help and technical and professional men. This was due partly to the desire of many persons who had formerly been laborers or mechanics to secure positions as clerks or superintendents, and also to the large number of new projects requiring executive and technical abilities which are being held up pending the ratification of the treaty of peace and the determination of future financial conditions. This condition was intensified by the large number of executive and technical men being released from the Army.

The following statement shows the number of soldiers registered and referred to employment from camps and transports:

Soldiers on transports.

	Regis- tered.	Needing assist- ance.
1919:		
April.....	39,068	23,217
May.....	223,222	78,492
June.....	261,109	62,640
Total.....	523,399	164,349

Soldiers at camp and on transports.

	Dis- charged.	Inter- viewed.	Needing assist- ance.
1918: November and December.....	591, 738	124, 391	53, 122
1919:			
January.....	396, 385	276, 972	100, 720
February.....	257, 462	182, 057	70, 118
March.....	240, 394	185, 774	73, 707
April.....	352, 806	297, 487	126, 807
May.....	342, 714	^a 486, 948	145, 823
June.....	380, 395	^a 502, 356	136, 212
Total.....	2, 561, 894	2, 055, 985	706, 509

^a Some men registered on transports and again at camps.

Of the above total needing assistance, 115,096 were referred direct to employers, the remainder to bureaus.

In addition to the above, the following were registered at camps by agents of other Government departments:

Emergency Fleet Corporation.....	5, 954
U. S. Merchant Marine.....	4, 337
U. S. Railroad Administration.....	6, 069
Total.....	16, 360

The number of service men registering for employment and the number actually placed are shown in the following table:

	Regis- tered.	Placed.		Regis- tered.	Placed.
Dec. 1, 1918, to Feb. 1, 1919....	49, 481	30, 711	Week ended—

Division of Information.—From July 1, 1918, to the signing of the armistice in November, this division organized and executed a national publicity campaign for the recruiting of workers for war industries. It also published the United States Employment Service Bulletin, the official organ of the service.

The campaign was directed toward inducing workers employed in nonwar work to seek war work and toward educating employers in nonwar work as to the necessity of releasing their employees for war production. This was accomplished through the spread of material to newspapers, trade and other class periodicals, general magazines, posters, motion pictures, and advertisements. The advertising

feature of the campaign was conducted like other Government war advertising drives, the "copy" being prepared with the assistance of the Division of Advertising of the Committee on Public Information and inserted in newspapers and periodicals by advertisers, the publications themselves, or through a central fund raised by the business interests of particular communities.

The regulation of unskilled labor recruiting under supervision of the United States Employment Service by the presidential order, on August 1, necessitated a vast amount of publicity to explain the provisions and operation of the order and the recruiting regulations to employers and the public generally. In this connection the United States Employment Service Bulletin proved of incalculable value.

Upon the signing of the armistice and the beginning of industrial and military demobilization the Information Division organized the national "Jobs-for-soldiers" publicity campaign. A second advertising campaign was inaugurated along the lines of that conducted during the war, the "copy" of the second campaign designed to increase buying and the resumption of business and to cause employers to keep their employment openings registered with the central agencies in their communities, at which the applications of soldiers and war workers for employment were received.

In its national "Jobs-for-soldiers" campaign the Department was able to make uniform the publicity throughout the country in connection with assisting soldiers to employment and in stimulating local campaigns. Largely through publicity communities were educated to continue regular or emergency employment offices after failure of funds for the Federal Employment Service in March made it necessary for it to abandon most of its offices in the field.

With the help of the publicity departments of the cooperating organizations the Information Division obtained the national observance of May 4, 1919, as "Employment Sunday" in the churches of all denominations of the country. In addition to a proclamation by the President, the governors of the majority of the States and the mayors of the principal cities proclaimed or indorsed "Employment Sunday" as a day to initiate more intensive efforts in finding employment for soldiers, sailors, and war workers.

Since the successful operation of any public employment system depends upon the extent to which employers use it, publicity to educate them to its use and to apprise them of the location of the various offices was a prerequisite, especially since it was impossible for the Employment Service to pay for direct advertising.

Division of Control.—The Control Division was organized on August 5, 1918. This division is concerned with the audit and payment of accounts, the preparation and issuance of orders, the compilation of statistics, preparation of general correspondence, the

supervision of the filing system, and the procurement and distribution of equipment and supplies of all kinds. The matters coming under the jurisdiction of this division are such as are necessarily incident to the conduct of an organization like this service and the administration of its fiscal and other routine affairs.

Division of Organization.—The Field Organization Division (name subsequently changed to Organization Division) was created August 5, 1918, for the purpose of establishing a systematic organization of employment offices in States and Territories. It was charged with the following duties:

(a) To perfect an efficient system of employment offices in each State.

(b) To create and perfect the organization of the State Advisory Boards and Community Labor Boards.

(c) To supervise the work of the Public Service Reserve and Boys' Working Reserve, and wherever possible to merge these with the Employment Service organization in each State.

(d) To see that proper facilities were provided for women's departments in employment offices.

(e) To see that proper facilities were provided in local employment offices for handling farm labor and such other classes of workers as may need specialized handling.

In fulfillment of these duties the Organization Division organized and developed by its corps of national field organizers 854 employment offices throughout the States and in Porto Rico. It created a State Advisory Board in each State in the country. It also created 1,600 Community Labor Boards, located throughout the various communities in the country and it provided women's departments in every State in the Union as well as facilities for the handling of farm labor. Special facilities were also created for the training of the personnel throughout the country, for a series of trade tests and interviews, and a Junior Section.

Personnel Section.—Prior to August 5, 1918, the work incident to making appointments and changes in the personnel was handled in a personnel section. After that date, the Personnel Division was organized as a separate branch of the Administrative Offices, and was enlarged so as to provide separate sections for appointments and personnel records, training of employees, welfare work, and trade interview methods. Plans were outlined for the development of these lines of activity but could not be fully worked out on account of the curtailment made necessary because of shortage of funds.

Owing to a change in the appropriation in July, 1918, new appointments had to be issued to all employees, which caused a large amount of detail work, as there were at that time in the neighborhood of two thousand employees. The number continued to increase until

the latter part of February, when a policy of retrenchment had to be adopted for the reasons above stated.

The organization reached its highest point about February 15, 1919, at which time there were 4,079 salaried employees, to which may be added 3,073 appointees at a nominal compensation of \$1 per annum. The latter class included chairmen of Community Labor Boards, industrial advisers to draft boards, managers of Bureaus for Returning Soldiers, Sailors, and Marines, farm labor agents, and others who were actively cooperating with the Employment Service.

As the organizations in the various States were perfected, new appointees had to be obtained with the utmost expedition, on account of the urgent demands made upon the service for workers of all kinds, particularly in munition and shipbuilding plants and in the harvest fields. During the months of July, August, September, and October, new appointments were issued at the rate of from 100 to 200 per week. On March 22, 1919, it was found necessary to curtail the expenses of the service and the personnel was reduced practically 80 per cent. Those whom it was not possible to retain upon a salary basis were either discontinued or given indefinite furloughs without pay. A great many of them were willing to volunteer their services and continue to work at a nominal compensation.

Junior Section.—On December 9, 1918, the Junior Section was created. This section was charged with the guidance and placement of boys and girls under 21 years of age, the designation or appointment of duly qualified counselors and the provision of suitable methods and organization for the proper counseling of such applicants.

Economic and other conditions are yearly driving increasing numbers of boys and girls into industry. Their immature minds and partly developed faculties need proper direction. A word of counsel and guidance or lack of it, at this time, may make or mar their future. Here exists a fruitful field for operation, and herein lies the need for promoting a practical and helpful organization.

The Junior Section organized and operated junior placement and vocational guidance offices in nine States in the Union. Through lack of funds these offices were greatly handicapped in their work, but the results accomplished fully demonstrated the value of junior placement work.

Boys' Working Reserve.—Since its organization under the Department, in April, 1917, the reserve has enrolled upward of 300,000 boys between 16 and 21 years of age, nearly all of whom went out from cities and towns to work in seasonal labor upon the farms.

By March, 1919, the reserve had completed its organization with a Federal State director in every State, the District of Columbia, and the Territory of Hawaii; had enrolled and placed about 300,000 boys; given intensive training in farm practices and farm machinery to

more than 50,000 city high-school boys; promoted many successful supply camps; supervised the leisure time and provided for the improvement and safeguarding of the young workers; and had returned to the schools a greater proportion of the boys than would have returned under normal conditions.

A conservative estimate of the economic value of the reserve indicates that its members added a hundred million dollars' worth of food to the world's supply at a time when food was most greatly needed. The following excerpts from reports will indicate this economic value.

A definite record was kept of about one-fourth of the Indiana reserve boys. These 6,055 boys earned a total of \$1,111,722. They worked an average of 114 days each at an average of wage of \$1.51 per day, exclusive of board. A verified record of 3,500 boys in Colorado shows earnings amounting to \$609,823. Reports from farmers in Massachusetts, based upon the cost of labor for each \$1,000 worth of farm products raised, showed that 2,500 boys added nearly \$2,000,000 to the food supply in Massachusetts last season. Reports on 600 boys give their average earning as \$166.66 per boy. In Oregon, 1,950 boys earned \$253,778. New York City boys of whom records were made, earned \$368,938.76 net. Their average production in acres was 16.4 per boy. Over 3,000 reserve boys in Texas averaged a little over 90 days' work each, and earned an average of \$1.10 per day net. A record of 860 Oklahoma boys showed 79,537 days' work, earning \$111,198.38, exclusive of board—about \$1.40 per day net. Many instances of liberty bond buying and money saving were reported. Of 145 reserve boys in a South Dakota high school, 117 have bank accounts, and saved \$10,040 last season.

Reserve high-school boys made good on the farms in over 90 per cent of the cases studied. Farmers everywhere declared these boys, when imbued by the patriotic spirit and training provided in training camps and schools, constituted the best form of emergency labor. Training was necessary if the boy was to fill the place of a farm hand released for the front and meet the reasonable expectations of the farmer.

This anticipation of the actual work done by courses in the elements of farm practices and in farm machinery becomes one of the most significant items in the reserve's program. Farm-craft lessons introduced into high schools in many States have become famous as a most significant educational development arising from the war emergency. Reports indicate that over 100,000 were in use this past winter. They are issued by the reserve in loose-leaf form and deal with farm practices generally throughout the United States. Used as a manual of instruction in the schoolroom they became a text to be taken to the laboratory, the barns, livery stables, implement stores, shops, and to the fields, in order that contact with the actual condi-

tions and equipment of farms might illustrate the elements of farm practice.

Training of boys was also furthered by the establishment, in cooperation with agricultural colleges and schools, of Central Farm Training Camps. In these camps they were taught by the faculty; brought into contact with the superior equipment of the schools; given physical exercise by which they became muscle-hardened, sun-bronzed, and "fit"; and attained a viewpoint which prepared them for new and unusual rural social and working conditions. Through the cooperation of the Young Men's Christian Association and other welfare agencies, and with the assistance of school men in nearly every State, reserve boys were everywhere safeguarded. In all training and supply camps leisure-time activities were well organized.

Women's work.—The recognition of the permanent importance of woman labor has led to striking developments in women's work during the past fiscal year. The war by July, 1918, had made woman labor a recognized industrial necessity. Because of this fact much effort has been expended to create adequate facilities to supply the demand for woman labor. Reconstruction months have continued, in the main, conditions created in the last months of the war. Registrations have not approached the level of help wanted calls. In November registrations were 50 per cent below help wanted; in January, 30 per cent; June, 29 per cent; year (10 months), 37 per cent. Weekly reports on labor surplus in industrial communities have not specified in 1919 any extensive period of unemployment among women. A study in May, 1919, showed that 22 per cent of employers' calls and 18 per cent of applications handled by the United States Employment Service are women. Twenty-one per cent of persons employed are women (Census, 1910).

Previous to July, 1918, service policies for women had been largely protective. They had led to a separate women's division, to separate placement offices, and to cooperation with organizations whose interest lay largely in protecting women workers from exploitation. Since the war has led to a keener interest in and developments for protecting women workers, the women's divisions of the United States Employment Service have been able, without neglecting this feature of women's work, to put a great deal of emphasis upon business methods, internal growth, and widening the field of opportunity for women. Offices placing women increased from about 50 to more than 400 in November. Placements jumped from 9,000 in January to 90,000 in October. Employers have been aided in trying women in new lines of work. Placement of large numbers in more settled lines has been successfully carried on. It has been proved that professional and skilled business women will gladly come to the Department of Labor for employment aid if facilities can be offered.

The registration and placement of women are shown in the following table:

Statistical report on women's work, July 1, 1918, to June 30, 1919.

Month.	Help wanted.	Registrations.	Reported placed.

a Figures not compiled.

b New statistical system not in complete operation accounts for placements being greater than registrations.

Women's Land Army.—The Women's Land Army was created in the spring of 1917 to meet the serious lack of farm labor. An experimental unit was placed in Bedford, N. Y., with attention to housing supervision of the unit and recruiting of girls from colleges and seasonal trades, and the adoption of standard wages and working and living conditions. In December, 1917, the Woman's National Farm and Garden Association, the Garden Club of America, and the Women's Committee of the Council of National Defense cooperated in the naming of an advisory council and an executive committee. In 1918 chairmen were appointed in 40 States and 15,000 women were placed on farms in 20 States.

In December, 1918, an agreement between the Women's Land Army and the United States Employment Service of the Department of Labor was signed to continue the Land Army on a peace basis under Government supervision. Plans for this agreement had been nearly completed before the armistice was signed. Continuing need for farm products and the Land Army's equipment for meeting shortages in seasonal emergencies led the Employment Service to adopt the plan at the later date. Under the supervision of the United States Employment Service, recruiting was carried on in offices of the Employment Service, but training and supervision were managed by the Land Army.

FARM AND HARVEST WORK.

Farm Service Division.—The Farm Service Division was created on December 13, 1918. The Farm Service Division received reports at regular intervals from the Assistant to the Federal Director in

charge of farm work in each State as to the agricultural needs in each State and was thus in a position to direct special efforts toward meeting the demands in localities where the situation became acute. During the period of the war the Department authorized the importation of Mexican labor, under certain conditions, for agricultural pursuits, railway maintenance of way, and mining in localities where such labor had been employed in the past. Shortly after the signing of the armistice the provisions for importing Mexican labor were canceled, with the exception that laborers from Mexico might still be admitted for the purpose of working in sugar-beet production. A special agent of the Employment Service was stationed at El Paso, Tex., to cooperate with the supervising inspector in charge of the Immigration Service at that place in reaching a decision as to the necessity for the importation of Mexican labor and supplying information as to conditions under which laborers would be required to work.

When the curtailment of the service became necessary in March, 1919, the services of many of the assistants to the Federal directors in charge of farm work in the various States had to be dispensed with, and in cases where the particular employee was retained he was assigned to duties relating to the general office work of the Federal director. In view of the limited funds at the disposal of the service it was considered entirely futile to attempt to conduct a special branch throughout the entire organization relating solely to farm work. There was set aside, however, a specified amount of the available appropriation to continue the organization of an Assistant to the Director General in Kansas City, Mo., for the purpose of mobilizing workers to handle the wheat crop in the grain belt.

As the main purposes for which the Farm Service Division was created no longer existed, that division was temporarily abolished in April, 1919, and the matters theretofore handled by it were referred to the Division of Operations or to other divisions to which they properly belonged.

A summary of the operations of the Farm Service Division from July 1, 1918, to April, 1919, when it was discontinued, shows that during this 10 months' period the Employment Service was called upon for 393,933 farm laborers and that it placed in agricultural work during the same period 221,096 persons. This record of placements does not include the thousands of harvest hands directed to employment through the Kansas City field office, concerning whom it is impossible to obtain a complete statistical report.

Harvest work, Kansas City field office.—The principal work of this office was in connection with the recruiting and distribution of harvest labor in the States of Oklahoma, Kansas, Missouri, Nebraska, and South and North Dakota, although surveys and

investigations as to the labor needs of other States have been made, notably in Louisiana and Montana.

Following the completion of the 1918 harvest in Oklahoma, Kansas, and Nebraska the field officers attached to this office proceeded northward for the purpose of assisting in the distribution of harvest labor in the States of Iowa and South and North Dakota. Distributing offices were opened in South Dakota in the following cities: Sioux Falls, Aberdeen, Mitchell, Watertown, and Redfield. Most of the labor used in South Dakota comes from the Kansas and Nebraska fields, through Sioux City, Iowa, and the majority of men stop off and call at the permanent office of the Employment Service located in that city for definite direction as to where work may be had. This office, together with the permanent office at Huron, S. Dak., and those temporarily established in the cities mentioned above, report the placement of 7,708 harvest hands during a period of four weeks, commencing about July 12.

Late in the fall of 1918 this office took an active part in recruiting labor for the sugar-beet and potato fields of western Nebraska. Two officers were stationed in Omaha for this purpose, while others proceeded into different parts of Missouri and Kansas on a like mission. Several hundred men were found and shipped into the district, much to the relief of the farmers and mill owners.

Early in the spring of 1919 it became apparent that unless unforeseen conditions arose the "big wheat belt" would harvest the largest acreage ever sown to wheat in a like area. Reports received from various sources indicated that Kansas had planted 10,759,000 acres to winter wheat (nearly one-fourth of all the winter wheat sown in the United States), Oklahoma 3,295,408, Nebraska 4,500,000, Missouri 4,243,000, and the States of Texas, South Dakota, North Dakota, Minnesota, and Iowa enough winter and spring wheat to bring the total to approximately 40,000,000 acres. Past experience made it plain that an army of men would be needed to harvest this enormous acreage, that it was unlikely sufficient labor for this purpose could be found within the States mentioned. As a part of the recruiting program 49,000 posters announcing the labor needs of the "big wheat belt" were mailed to as many post offices. That much interest was aroused is evidenced by the fact that during a period of six or seven weeks about 15,000 letters were received. Not only did the requests for further information come by regular mail, but by telegraph, long-distance telephone, and special-delivery service. These communications, representing some 30,000 to 40,000 individuals, were received from all parts of the United States and from persons in all walks of life. Engineers, cooks, men with teams, and other special classes were furnished. About two weeks before harvest time additional posters, announcing the location of all United States Employment Service offices in the wheat belt were put

up in as many different post offices in territory from which most of the labor was expected to come, the purpose being to draw as many men as possible into the various offices from where they could be rapidly distributed with the least loss of time among communities most urgently in need of their services and at a minimum expense for railway transportation.

Shortly before cutting time questionnaires were mailed requesting data as to number of harvest hands that would be needed, the probable cutting date, wages, and certain other needed information. From replies received it was found that many counties would be able to get along with local labor, which permitted the elimination of such counties from its calculations and the concentration of efforts on other districts. Reports indicated that Oklahoma would need from 10,000 to 12,000 men; Kansas, about 60,000; and Nebraska, about 6,000—this number being in addition to labor that might be found locally.

The total number of harvest hands needed throughout the wheat belt depends upon weather conditions. During a normal season harvest should start in north central Oklahoma about June 5 to 8, reaching the southern Kansas counties about June 15 to 18; the central Kansas counties about 10 days later, and the north central and northwestern territory about July 1 to 5. Under these conditions it becomes possible to utilize the services of many men who start in Oklahoma in the southern or central Kansas counties, and those who commence in southern Kansas finish in time to assist in the harvest in the north central and northwestern districts. However, as it frequently happens and did this year, the Oklahoma harvest was delayed by cold and wet weather until about June 15. Immediately following this date a period of hot weather set in which hastened the ripening of the grain throughout Kansas and caused nearly all districts to call for labor, and to aggravate the gravity of the situation the southeastern and southern Nebraska fields commenced operations, making it necessary to supply three States with men at the same time.

From the following table it will be noted that the various offices have reported an (estimated) attendance of 93,338 and the actual placement of 46,242:

State.	Estimated attendance.	Placed.
Oklahoma.....	29,872	10,593
Kansas.....	25,745	12,085
Missouri.....	21,208	10,705
Nebraska.....	5,241	5,110
South Dakota.....	7,442	6,200
Iowa.....	3,830	1,549
Total.....	93,338	46,242

Wages in the harvest fields have been higher this year than ever before. Sixty cents per hour and transportation from Kansas City and other distributing points, or 70 cents without railway fare, became the standard. In Nebraska the prevailing scale has been 50 and 60 cents per hour with board.

The very high cost of railway transportation has proved the greatest obstacle in attracting a plentiful supply of harvest labor, and it became evident very early in the season that the wages as set at 50 cents per hour would not bring in the labor as rapidly as needed; and it was only after it became generally known that the wage had been advanced to 60 and 70 cents per hour that men reported in satisfactory numbers.

When it is realized that the fare to the fields from even such a near-by point as St. Louis amounts to approximately \$18, with a like sum involved for the return fare, it becomes a difficult matter to persuade men that there is much to be gained in harvest work. Many interested individuals and organizations, as well as this service and other governmental agencies, have made repeated appeals to the Railway Administration for a reduced railway rate to harvest hands, but so far without success. It is the opinion of the Kansas City field office that with normal labor conditions prevalent in the country during another harvest season, it will require either an abnormally high wage scale or a material reduction in railway rates to bring in sufficient labor to harvest the crops.

EMPLOYMENT STATISTICS.

The following tables summarize the employment activities so far as it is possible to reduce them to figures. Table 1 deals with the activities of the service during the fiscal year ended June 30, 1919; while Table 2 covers the entire period during which the Employment Service has operated as a separate branch of the Department, that is, from January, 1918, to June, 1919, inclusive.

TABLE 1.—Activities of the United States Employment Service during the fiscal year ended June 30, 1919, by months.

18 months.....	7,133,831	12,104,184	6,470,516	4,976,320

From Table 2 it will be noted that approximately 10,000 persons were placed in jobs of all kinds each working day for the 18 months' period, and this without costing them or their employers a cent and at a cost to the whole country of but \$1.34 per placement. The saving in fees to the men and women directed to employment by the Federal Government in cooperation with States and municipalities is estimated at not less than \$10,000,000, while the saving to the country in hours of labor gained by minimizing the time lost by these workers between jobs and in reducing labor turnover is estimated at many more millions.

Placements were made of every kind of worker, from common laborers and domestics to high-salaried professional and technical workers. It was not uncommon for a \$1,800 examiner to place a \$15,000 engineer or executive. The recruiting and placing of farm labor has been one of the special features of the work of the Federal Employment Service during the last year and a half.

Women constituted 20 per cent of the total workers placed and many a woman has found in the Federal Employment Service a gateway to the industrial, commercial, or professional life she has desired to enter. Large numbers of college-trained women have used the service, which has been working in conjunction with alumnus associations throughout the country.

The common-labor placements were but 23 per cent of the total of slightly under 5,000,000 persons placed. The other 77 per cent consisted of skilled labor and other workers engaged in specified occupations.

In arriving at its figure of \$1.34 as the average cost per placement the United States Employment Service has included all the cost of

building up and equipping the service. In private corporate financing, these items would be considered as permanent investments and would not be chargeable to operation.

DEPARTMENTAL RECOMMENDATIONS.

IMPROVEMENT OF THE WORKING CONDITIONS OF WAGE EARNERS.

In the performance of all its duties the Department has always been mindful of the fact that the self-respect and prosperity of a Nation are but the aggregate of the self-respect and prosperity of its citizens. And as the great mass of the population of the United States is engaged in wage-earning employment, any advancement in the condition of the workers must necessarily contribute in equal proportion toward the welfare of the country as a whole. Indeed, the Department believes that in order to fulfill the obligations laid upon it by its organic act it must devote its utmost efforts toward improving the conditions surrounding the worker in industry. By that act the function of the Department "shall be to foster, promote, and develop the welfare of the wage earners of the United States, to improve their working conditions, and to advance their opportunities for profitable employment."

During the war the Department was authorized to set up machinery for investigating working conditions, and where advisable to recommend standards for their improvement. In another portion of this report the accomplishments of the Working Conditions Service so established are given in some detail and need not be repeated here. It is sufficient to say that although this organization was primarily treated for the purpose of stimulating war production the results of its activities have been such as to assure the value of its services in times of peace. It is therefore strongly urged that early legislation be enacted with a view to reviving and continuing the activities of the Working Conditions Service.

TEMPORARY ADMINISTRATIVE ASSIGNMENTS.

In the annual reports of the four preceding years attention has been called to the embarrassing situations which have arisen through the increase of departmental work. It is highly desirable that greater elasticity should be obtained through temporary administrative assignments. It is therefore again recommended that section 179 of the Revised Statutes be so amended as to empower the President to afford relief through Executive order by adding the following clause:

The officer so authorized and directed in anticipation of vacancy, sickness, or absence shall have authority meanwhile to perform such duties as the head of the Department to which the President assigns him shall prescribe.

SUPERANNUATION AND RETIREMENT.

Previous reports have also pointed out the embarrassing situation in which the Department frequently finds itself with respect to such of its employees as have been in Government service for many years. This Department, like many others, frequently finds itself in the dilemma either of maintaining on its rolls persons who have outlived their usefulness and thus impairing departmental efficiency or of discharging many who by reason of long and faithful service deserve more considerate treatment. Such a situation can best be obviated by the establishment of an equitable system of retirement under such terms as shall subserve the interests of efficiency and economy, and at the same time insure fair financial provision for the old age of faithful employees.

TRAINING OF WORKERS.

The duty of encouraging the wageworker to prepare himself for more profitable employment is clearly within the scope of this Department. Again referring to the organic act creating the Department of Labor, we find the clause charging it with advancing the opportunities of the wage earner for profitable employment. It has been proved, not only in this country but in others as well, that the most effective method of increasing and improving the workers' capacity for production is through training opportunities within the industries themselves.

As part of his war duties the Secretary of Labor was charged, in January, 1918, by the President with the creation of an agency that would furnish "a satisfactory method and administration for training of workers." In accordance with that mandate the Training and Dilution Service, later known as the United States Training Service, was organized within the Department. Although directed principally toward those industries affected by the war, its activities have, as a matter of fact, been far more reaching in their effect. Under their stimulus many industries, realizing the value of training in time of peace as well as during war, have endeavored to continue their efforts toward training workers, although the guidance and encouragement of the Government have been withdrawn.

It is believed that increased skill on the part of the workers, and its consequent stimulus toward greater production, is even more important in peace than in war. And it is felt that the work formerly conducted by the United States Training Service, with the ideal of establishing a means whereby wage earners may continuously advance in industrial growth and development, is so urgently needed

by industry throughout the country as to warrant continuation of its activities. I recommend, therefore, the enactment of legislation to accomplish that end.

INCREASE IN PER DIEM IN LIEU OF SUBSISTENCE.

I also desire again to call attention to certain hardships laid upon many persons engaged in travel for the Department. Under the terms of the appropriations granted to the Department, the total amount which can be allowed outright for subsistence is \$4 per diem. This limit was fixed upon originally August 1, 1914.¹ At that time the limitation was quite reasonable and no doubt necessary in order to limit unnecessary extravagance and waste of public funds. Since then, however, there has been a marked increase in the cost of living, and in particular of the two principal items (food and lodging) embraced within the meaning of the term subsistence. The figures of the Bureau of Labor Statistics, which are most conservative, indicate that the cost of foodstuffs during the period since the adoption of the limitation has greatly advanced. Thus the purchasing power represented by \$4 to-day is equivalent to only \$2.27 at the time of the adoption of the rule. In consequence faithful employees of the Department find themselves forced to draw upon their own means to make up the deficit between their actual expenditure and the permitted sum. The greater number of these persons are those who are serving the Government at modest salaries, which have not kept pace with the cost of living. They can least afford further drains upon their means. I therefore feel that an increase in the amount allotted for subsistence is imperative and recommend that it be advanced from \$4 to \$6 per diem.

MEASURES FOR RELIEF OF UNEMPLOYMENT.

Not the least of the factors which made for national efficiency during the war was the proper distribution of labor. Prior to the war it was our custom to disregard the fact that while large numbers of men were seeking employment in some parts of the country, production was seriously hindered for lack of man power in others. During the war efficiency was brought about by bringing together these two vital and complementary factors in production through the United States Employment Service. Unfortunately since the war the department has been forced to so drastically curtail the activities of that service as to render it ineffective of its purpose. If the department is to fulfill the purposes for which it was created not only must legislation be passed permanently establishing the Employment Service, but it must receive liberal appropriations as well.

¹ Act August 1, 1914, ch. 223, sec. 13, Stat. 680.

If we are to deal adequately with the problem of unemployment, however, we must not stop with the mere distribution of labor. Distribution itself would be sufficient if the number of opportunities for work and the number of men seeking employment were approximately equal. This, however, is not the case. Normally, there are many more men seeking work than we can properly provide for in our various industrial and agricultural undertakings. The ultimate remedy lies in the creation of new opportunities for employment. Such new opportunities may only be created by a more adequate use of our land and natural resources. To that end I urge that legislation substantially in accord with the views presented elsewhere in this report (pp. 195-199) be enacted.

The whole world is face to face with the most difficult peace-time problem it has ever had to deal with. The wastage of war has been tremendous. There has been not only the loss of millions of lives and the permanent disability of other millions of people but also an extraordinary destruction of the material resources of the world. The power of replacement of the things destroyed has been seriously impeded by the conditions that constitute the aftermath of war. Industry has been disarranged by the processes of readjustment to the needs of peace, and commerce has been handicapped by insufficient shipping facilities, rates of foreign exchange, and domestic uncertainty. Many countries are without stable government, and financial inflation in all the commercial countries of the world has played havoc with the relative values of money, wages, and commodities.

The effect of these things has been reflected in the high cost of living and the consequent demand for higher wage rates to meet the increasing burden of the family budget. Yet increases in the wage rate do not always give relief. There are but two ways by which the general standard of living of the wage earner can be improved. One is by increased productivity, making more material available for wages. The other is by taking the means of increased compensation out of the profits of the employer. If wages are increased and profits remain the same, the burden is passed on to the consuming public in the form of an increased cost of living and comes back to the wage worker himself. No portion of improved living standards can come out of the profits of the employers unless there is profiteering.

And what gives the opportunity for profiteering? The very conditions that we are confronted with to-day--the destructive agencies of war, the disarrangement of industry and commerce, and the unrest and high nervous tension of our people, resulting in a shortage of supply as compared with demand. The whole world is interested in returning to the highest productive efficiency, having due regard to the health, safety, and opportunities for rest, recreation, and improvement of those who toil. The more productive we are the

sooner we shall replace the wastage of war, return to normal price levels, and abolish opportunities for profiteering. There can be no profiteering where the production is ample to meet the needs of the people of the world if there is a free flow of material from producer to consumer. It is only where the production is not sufficient for the needs of the people, or, when sufficient, where artificial obstructions impede proper distribution, that there is any possibility of profiteering. Anything that restricts the highest efficiency commensurate with the physical, mental, and spiritual well-being of the workers tends to retard the progress of the country as a whole.

For that reason we are all interested in the maintenance of industrial peace. But as this Department declared in its first annual report, there can be no permanent industrial peace that is not based upon industrial justice. Just as international wrongs may accumulate to the point where war is necessary to bring relief, so industrial wrongs may provoke industrial conflict as an alternative to further endurance of the wrongs imposed. Nor is it permissible that either side to an industrial controversy be the sole judge of what constitutes justice. The means must exist by which all men may know that justice has been secured. An imaginary wrong has all the force and effect of reality until it is shown that it is only imaginary. We have found ways of regulating all the other relations of mankind. Surely human intelligence can devise some acceptable method of adjusting the relationship between employer and employee fairly.

It has always been the opinion of this Department that in mutual counsel lies the stability of industrial relations. Just as the peace of nations is promoted by frank and friendly intercourse, so may the peace of industry be maintained by the same methods.

But this intercourse can not come about unless there is first recognized the right of collective bargaining. In the past this right has been conceded by some employers but vigorously combated by others. Whatever may have been the reasons which actuated employers in the past in the denial of that right, it is certain that more and more have conceded it each year. The public interest demands that it be universally recognized, for the primary interest of the public is in peace, and the denial of organization is a denial of the only means of peaceable settlement that wage earners have. At a time when labor organizations of a revolutionary or lawless type are especially in the public eye, it is particularly important to point out that the responsibility for the development of such organizations must in the long run fall upon the employer who denounces the organization of lawful trade-unions.

In an imperfectly developed state of society or in minor instances this failure to recognize the rights of others injures only the persons immediately concerned. But with the increase in the size of productive enterprises and the corresponding increase in the numbers of

employees, many industrial disputes take on such a character as to concern not only the special interests immediately involved but also to menace many whom for want of a better name we may call the innocent bystanders. Modern strikes and lockouts tend more and more to affect not only the employer and worker but all who come within range of the economic controversy. At no time has this been more important than at present.

The right of any man to cease working for another for any reason that is sufficient to himself is the basic element of human liberty. The right of any person to refuse to operate his plant at any time he desires to do so is the exercise of a property right guaranteed by the Constitution. It does not follow that because these rights exist it is necessary to exercise them. They must nevertheless be safeguarded. Having done that and having devised the machinery by which justice can be secured and by which everybody at interest has the opportunity of knowing that justice has been secured, it is not likely that the right to cease work will be exercised by sufficient numbers, or the right to cease operating industrial plants will be carried to such an extent, as seriously to affect the welfare of the rest of the people. It is with such thoughts as these in view that I urge upon my fellow-countrymen the exercise of the utmost tolerance and the maximum of good will and mutual forbearance during the trying days that are upon us.

W. B. WILSON, *Secretary.*
